(6)Classification of Lorentz matrices.

## (1) Context

This text is a enhanced partial translation of : https ://archive •org/details/matricesdelorentz/mode/2 up

## (2)Basic principles :

$(\boldsymbol{\alpha})$ We consider a point (or observer) $\boldsymbol{O}$, in an affine space $\boldsymbol{E}$, which models our physical spatial space, of direction $\overrightarrow{\boldsymbol{E}}$, vector space in $\mathbf{3}$-dimensional Euclidean isomorphic to $\mathbb{R}^{3} \cdot$ We associate $\boldsymbol{O}$ with an orthogonal coordinate system $\boldsymbol{R}(\boldsymbol{O}, \boldsymbol{x}, \boldsymbol{y}, \boldsymbol{z})$ with a base $\boldsymbol{B}(\boldsymbol{O}, \overrightarrow{\boldsymbol{i}}, \overrightarrow{\boldsymbol{j}}, \overrightarrow{\boldsymbol{k}})$ with its natural Euclidean structure.
We provide $\boldsymbol{O}$ with a clock which measures time $\boldsymbol{t}$.
We suppose that at each point, fixed with respect to $\boldsymbol{O}$, of the coordinate system $\boldsymbol{R}$ is associated with a clock synchronized with that of $\boldsymbol{O}$ which measures the same time $\boldsymbol{t}$.
Synchronizing Clocks allows to have a variable tindependent.
We assume that $\boldsymbol{R}$ is Galilean that is to say if a moving point, left to itself, on which acts no force, continues its trajectory in straight line,
at one uniform speed •This hypothesis implies the existence of one only time,
except for a change of origin or a change of unit.
We can thus construct a vector space with 4 dimensions and
a frame $\mathscr{R}\left(\boldsymbol{O}_{\boldsymbol{t}=\boldsymbol{0}}, \boldsymbol{t}, \boldsymbol{x}, \boldsymbol{y}, \boldsymbol{z}\right), \boldsymbol{O}_{\boldsymbol{t}=\boldsymbol{0}}$ representing the point $\boldsymbol{O}$ at time $\boldsymbol{t}=\mathbf{0}$ in this space, associated with a base $\mathscr{B}\left(\boldsymbol{O}_{\boldsymbol{t}=\boldsymbol{0}}, \boldsymbol{c} \overline{\boldsymbol{\tau}}, \overline{\boldsymbol{i}}, \overline{\boldsymbol{j}}, \overline{\boldsymbol{k}}\right)$ orthonormal for the bilinear symmetric form form, $\phi(\boldsymbol{t}, \boldsymbol{x}, \boldsymbol{y}, \boldsymbol{z})=\boldsymbol{c}^{2} \boldsymbol{t}^{2}-\boldsymbol{x}^{2}-\boldsymbol{y}^{2}-\boldsymbol{z}^{2}(\boldsymbol{c}$ being the speed of light $)$ ).
$(\beta)$ We consider another point (or observer) $\boldsymbol{O}^{\prime}$ 'having a uniform speed $\overrightarrow{\boldsymbol{V}}$ relative to $O$ and measured by $\boldsymbol{O}$ with which is also associated an orthorormal coordinate system $\boldsymbol{R}^{\prime}\left(\boldsymbol{O}^{\prime}, \boldsymbol{x}^{\prime}, \boldsymbol{y}^{\prime}, \boldsymbol{z}^{\prime}\right)$ associated with a base $\boldsymbol{B}^{\boldsymbol{\prime}}\left(\boldsymbol{O}^{\prime}, \overrightarrow{\boldsymbol{i}^{\prime}}, \overrightarrow{\boldsymbol{j}^{\prime}}, \overrightarrow{\boldsymbol{k}^{\prime}}\right)$ with its natural Euclidean structure. We provide $\boldsymbol{O}$ with a clock which measures time $t$.
We suppose that at each point, fixed with respect to $\boldsymbol{O}^{\prime}$, of the coordinate system $\boldsymbol{R}^{\prime}$ is associated with a clock synchronized with that of $\boldsymbol{O}^{\prime}$ which measures the same time $t^{\prime}$. Synchronizing Clocks allows to have a variable t' independent.
We assume that $\boldsymbol{R}^{\prime}$ is Galilean.
Also we can thus construct a vector space with 4 dimensions and
a frame $\mathscr{R}^{\prime}\left(\boldsymbol{O}_{\boldsymbol{t}=\boldsymbol{0}}^{\prime}, \boldsymbol{t}^{\prime}, \boldsymbol{x}^{\prime}, \boldsymbol{y}^{\prime}, \boldsymbol{z}^{\prime}\right), \boldsymbol{O}_{\boldsymbol{t}^{\prime}=\boldsymbol{0}}^{\prime}$ representing the point $\boldsymbol{O}^{\prime}$ at time $\boldsymbol{t}^{\prime}=\mathbf{0}$ in this space, associated with a base $\mathscr{B}\left(\boldsymbol{O}_{\boldsymbol{t}^{\prime}=\boldsymbol{0}}^{\prime}, \boldsymbol{c} \overline{\tau^{\prime}}, \overline{\boldsymbol{i}^{\prime}}, \overline{\boldsymbol{j}^{\prime}}, \overline{\boldsymbol{k}^{\prime}}\right)$ orthonormal for the bilinear symmetric form form , $\phi^{\prime}\left(\boldsymbol{t}^{\prime}, \boldsymbol{x}^{\prime}, \boldsymbol{y}^{\prime}, \boldsymbol{z}^{\prime}\right)=\boldsymbol{c}^{2} \boldsymbol{t}^{\prime 2}-\boldsymbol{x}^{\prime 2}-\boldsymbol{y}^{\prime 2}-\boldsymbol{z}^{\prime 2}(\boldsymbol{c}$ being the speed of light $)$ ).

We will assume that the $\mathbf{2}$ observers pass through the same point of $\boldsymbol{E}$ during their journey
and at this time,
$\boldsymbol{O}$ and $\boldsymbol{O}$ 'set their clock to $\mathbf{0}$ We will assume that the $\mathbf{2}$ observers pass through the same point of $\boldsymbol{E}$ during their journey and at this time, $\boldsymbol{O}$ and $\boldsymbol{O}$ 'set their clock to $\mathbf{0}(\boldsymbol{t}=\boldsymbol{t}$ ' $=\boldsymbol{0})$.
This nonessential hypothesis simplifies the calculations and we will talk about the bases $\mathcal{B}(\boldsymbol{O}, c \bar{c}, \overline{\boldsymbol{i}}$, $\overline{\boldsymbol{j}}, \overline{\boldsymbol{k}})$
and $\mathscr{B}^{\prime}\left(\boldsymbol{O}, c \overline{\tau^{\prime}}, \overline{\boldsymbol{i}^{\prime}}, \overline{\boldsymbol{j}^{\prime}}, \overline{\boldsymbol{k}^{\prime}}\right)$ by setting $\boldsymbol{O}=\boldsymbol{O}_{\boldsymbol{t}=\boldsymbol{0}}=\boldsymbol{O}_{\boldsymbol{t}^{\prime}=\boldsymbol{0}}^{\prime}$.
Otherwise we can consider a third observer $\boldsymbol{O}^{\prime \prime}$, having the same uniform speed .
$\overrightarrow{\boldsymbol{V}}$ relative to $\boldsymbol{O}$, but whose trajectory, a straight line parallel to that of $\boldsymbol{O}^{\prime}$, intersects that of $\boldsymbol{O}$. The spatio - temporal units being defined by the physical laws which we will suppose to be the same in the $\mathbf{2}$ frames, we will choose the same units in the $\mathbf{2}$ frames.
$(\gamma)$ We assume that the photons move in a straight line at speed $\boldsymbol{c}$, independently of the considered reference frame. We also assume that $\mathbf{c}$ is the maximum possible speed.
This implies that for a photon emitted from $\boldsymbol{O}$ at time $\boldsymbol{t}=\mathbf{0}$, that is to say also from $\boldsymbol{O}^{\prime}$ at time $\boldsymbol{t}^{\prime}=\boldsymbol{0}$, its coordinates in $\mathscr{B}$ and $\mathscr{B}^{\prime}$ will check simultaneously:
$c^{2} \boldsymbol{t}^{2}-x^{2}-y^{2}-z^{2}=0 \Leftrightarrow c^{2} t^{\prime 2}-x^{\prime 2}-y^{\prime 2}-z^{\prime 2}=0$ (conservation of the cone of light).
(3) Relative velocity of 2 frames:

In classical mechanics, if we consider $\mathbf{2}$ observers $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$ in uniform relative motion to the other we can write that $\overrightarrow{\boldsymbol{V}_{\boldsymbol{O} \mid \boldsymbol{O}}}=\overrightarrow{-\boldsymbol{V}_{\boldsymbol{O} \mid \boldsymbol{O}}}$, for these 2 observers :
the time is absolute as well as the distance $\left\|\overrightarrow{\boldsymbol{O O}^{\prime}}\right\|$.
In special relativity, the laws of physics are the same in the $\mathbf{2}$ frames in uniform relative motion to the other, that is to say that same objects placed under the same conditions will produce the same effects :
Measuring velocity of $\boldsymbol{O}^{\prime}$ relative to $\boldsymbol{O}$ and measuring the velocity of $\boldsymbol{O}$ relative to $\boldsymbol{O}^{\prime}$ will give the same result as long as these 2 velocities have the same norm .
As the 2 measured times $\boldsymbol{t}$ and $\boldsymbol{t}^{\prime}$ are different likewise for spatial coordinates, Now remembering that at this stage of the study, we only know that the transformation is linear and that the velocity of light is invariant, we will justify in an elementary way that the relative velocity of the 2 frames in uniform translation has the same norm, measured in one or the other frame and vectorially opposite.
Let be two spatial frames $\mathscr{R}$ and $\mathfrak{R}^{\prime}$ in uniform translation. Let assume that their origins $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$ coincide only once at during their relative movement at a point in the spatial space and at this point the clocks of the two spatial frames are set to $0: \boldsymbol{t}=\boldsymbol{t}^{\prime}=\mathbf{0}$.
We recall that the time associated with any fixed point by relation to $\boldsymbol{O}$ in $\mathfrak{R}$ is synchronized with $\boldsymbol{O}$.
Similarly for the time associated with any fixed point by relation to $\boldsymbol{O}^{\prime}$ in $\mathfrak{R}^{\prime}$ is synchronized with $\boldsymbol{O}^{\prime}$.
We can thus define the uniform velocity of a point $\boldsymbol{P}(\boldsymbol{t})$ with respect to $\boldsymbol{O}$ in $\mathfrak{R}$ by:

$$
\left(\vec{V}_{P} \mid \boldsymbol{o}\right)_{\mathscr{R}}=\frac{\overrightarrow{O P\left(t_{1}\right)}-\overrightarrow{O P\left(t_{0}\right)}}{\boldsymbol{t}_{\boldsymbol{1}}-\boldsymbol{t}_{\boldsymbol{0}}} \text {. Similarly in } \mathcal{R}^{\prime}
$$

Knowing that $\overrightarrow{\boldsymbol{O \boldsymbol { O }}}{ }^{\prime}(\mathbf{0})=\overrightarrow{\boldsymbol{0}}$, we have in $\mathscr{R}$ :
$\left(\overrightarrow{\mathcal{V}}_{O^{\prime}} \mid o\right)_{\mathscr{R}}=\frac{\overrightarrow{\boldsymbol{O O}}{ }^{\prime}(\boldsymbol{t})}{t}=-\frac{\overrightarrow{\boldsymbol{O}^{\prime} \boldsymbol{O}(\boldsymbol{t})}}{\boldsymbol{t}}=-\left(\overrightarrow{\mathcal{V}}_{\boldsymbol{O}} \mid o^{\prime}\right)_{\mathscr{R}} \quad$,
Similarly in $\mathfrak{R}^{\prime}$ knowing that $\overrightarrow{\boldsymbol{O}^{\prime} \mathbf{O}(\mathbf{0})}=\overrightarrow{0}$ :
$\left(\vec{V}_{\boldsymbol{O}} \mid \boldsymbol{o}^{\prime}\right)_{\mathbb{R}^{\prime}}=\frac{\overrightarrow{\boldsymbol{O}^{\prime} \boldsymbol{O}\left(\boldsymbol{t}^{\prime}\right)}}{\boldsymbol{t}^{\prime}}=-\frac{\overrightarrow{\boldsymbol{O O ^ { \prime } ( \boldsymbol { t } ^ { \prime } )}}}{\boldsymbol{t}^{\prime}}=-\left(\vec{V}_{\boldsymbol{O}^{\prime} \mid \boldsymbol{o}}\right)_{\mathbb{R}^{\prime}}$.
Is true that : $\left(\vec{V}_{\boldsymbol{O}^{\prime} \mid \boldsymbol{o}}\right)_{\boldsymbol{R}^{\prime}}=-\left(\overrightarrow{\boldsymbol{V}}_{\boldsymbol{O} \mid \boldsymbol{o}^{\prime}}\right)_{\mathfrak{R}^{\prime}}$ ?
We already know that these 2 velocities $\underset{\rightarrow}{\text { are parallel to }} \overrightarrow{\boldsymbol{O O}}^{\prime}$, constant and in opposite directions.
Let us evaluate their respective norm Let $\overrightarrow{\mathcal{V}}$ be the vvelocity of $\boldsymbol{O}$ 'relative to $O$ in $\mathfrak{R}$.
How to measure $\|\overrightarrow{\mathcal{V}}\|$ ? For this we are going to carry out a simple experiment measured from $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$. We will note $\mathscr{R}_{4}$ and $\mathscr{R}_{4}{ }^{\prime}$ the frames in the space in 4 dimensions, associated with $\mathscr{R}$ and $\mathfrak{R}^{\prime}$ and at their respective clock.
As the transformation which makes it possible to pass from $\mathscr{R}_{4}$ to $\mathscr{R}_{4}^{\prime}$ is linear, it can be represented by a matrix $\boldsymbol{M}, \mathscr{R}_{4}$ and $\mathscr{R}_{4}$ being provided with adequate orthonormal bases $\mathscr{B}$ and $\mathscr{B}^{\prime}$.
Experiment:
At time $\boldsymbol{t}=\boldsymbol{t} \boldsymbol{\prime}=\mathbf{0}, \boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$ coincide.
At time $\boldsymbol{t}=\boldsymbol{t}_{\boldsymbol{0}}>\mathbf{0}$ we send a light ray from $\boldsymbol{O}$ to $\boldsymbol{O}^{\prime}$ which returns it to $\boldsymbol{O}$ at time $\boldsymbol{t}=\boldsymbol{t}_{\boldsymbol{r}}$, and reaches $\boldsymbol{O}$ at time $\boldsymbol{t}=\boldsymbol{t}_{2}$,
We denote by $\boldsymbol{O}^{\prime}(\boldsymbol{t})$ and $\boldsymbol{O}(\boldsymbol{t})$ the position of $\boldsymbol{O}^{\prime}$ and $\boldsymbol{O}$ at time $\boldsymbol{t}$ in $\mathcal{R}$.
We assume that the axis $\overrightarrow{\boldsymbol{O x}}$ is parallel to $\overrightarrow{\boldsymbol{O O}^{\prime}}$ :

As the movement is uniform rectilinear along the line defined by $\boldsymbol{O}$ and $\overrightarrow{\mathcal{V}}$ : we therefore have $\overline{\boldsymbol{O} \boldsymbol{O}^{\prime}\left(\boldsymbol{t}_{\boldsymbol{0}}\right)}=\|\overrightarrow{\mathcal{V}}\| . \boldsymbol{t}_{\boldsymbol{0}}$, similarly $\overline{\boldsymbol{O}^{\prime}\left(\boldsymbol{t}_{\boldsymbol{0}}\right) \boldsymbol{O}^{\prime}\left(\boldsymbol{t}_{\boldsymbol{1}}\right)}=\|\overrightarrow{\mathcal{V}}\| \cdot\left(\boldsymbol{t}_{\boldsymbol{1}}-\boldsymbol{t}_{\boldsymbol{0}}\right)$.
The duration being the same on the outward and return journey $\boldsymbol{t}_{\boldsymbol{1}}=\boldsymbol{t}_{\boldsymbol{0}}+\frac{\left(\boldsymbol{t}_{2}-\boldsymbol{t}_{\boldsymbol{0}}\right)}{2}=\frac{\left(\boldsymbol{t}_{\boldsymbol{2}}+\boldsymbol{t}_{\boldsymbol{0}}\right)}{2}$. If $\boldsymbol{c}$ is the speed of the light:

$$
\left(t_{2}-t_{0}\right) c=2\|\vec{V}\| t_{0}+2\|\vec{V}\|\left(t_{1}-t_{0}\right)
$$

therefore : $\left(\boldsymbol{t}_{2}-\boldsymbol{t}_{\boldsymbol{0}}\right) \boldsymbol{c}=\mathbf{2}\|\vec{\nu}\| \boldsymbol{t}_{1}$ and therefore: $\|\vec{\nu}\|=\frac{\left(\boldsymbol{t}_{2}-\boldsymbol{t}_{\boldsymbol{0}}\right)}{2 \boldsymbol{t}_{1}} \boldsymbol{c}=\frac{\left(\boldsymbol{t}_{2}-\boldsymbol{t}_{\boldsymbol{0}}\right)}{\boldsymbol{t}_{2}+\boldsymbol{t}_{\boldsymbol{0}}} \boldsymbol{c}$.
From the observer's point of view on $\boldsymbol{O}$ ', he sees a ray starting from $\boldsymbol{O}$ at time $t^{\prime}=t_{0}{ }^{\prime}$, and $\overline{\boldsymbol{O}^{\prime} \boldsymbol{O}\left(t_{0}{ }^{\prime}\right)}=\left\|\overrightarrow{\boldsymbol{V}^{\prime}}\right\| \cdot t_{0^{\prime}}$,.
the ray will arrive at time $\boldsymbol{t}_{\boldsymbol{1}}{ }^{\prime}$, then it will depart towards $\boldsymbol{O}$ which it will touch at time $t_{2}{ }^{\prime}$.
The ray will therefore have traveled the distance $\boldsymbol{c}\left(\boldsymbol{t}_{\mathbf{2}}{ }^{\prime}-\boldsymbol{t}_{\boldsymbol{0}}{ }^{\prime}\right)$.
In the direction $\overrightarrow{\boldsymbol{O O}^{\prime}}$ the distance traveled is : $\overline{\boldsymbol{O}^{\prime} \boldsymbol{O}\left(\boldsymbol{t}_{\boldsymbol{0}}{ }^{\prime}\right)}=\left\|\overrightarrow{\boldsymbol{V}^{\prime}}\right\|_{. \boldsymbol{t}_{\boldsymbol{0}}{ }^{\prime} \text { and in the return direction : }}$ and
$\left\|\overrightarrow{\mathcal{V}^{\prime}}\right\| \cdot t_{\boldsymbol{t}}{ }^{\prime}+\left\|\overrightarrow{\mathcal{V}}^{\prime}\right\| \cdot\left(\boldsymbol{t}_{\mathbf{1}}{ }^{\prime}-\boldsymbol{t}_{\boldsymbol{0}}{ }^{\prime}\right)+\left\|\overrightarrow{\mathcal{V}^{\prime}}\right\| \cdot\left(\boldsymbol{t}_{2}{ }^{\prime}-\boldsymbol{t}_{\boldsymbol{1}}{ }^{\prime}\right)=\left\|\overrightarrow{\mathcal{V}}^{\prime}\right\| \boldsymbol{t}_{2}{ }^{\prime}$ and therefore:
$\left(\boldsymbol{t}_{2}{ }^{\prime}-\boldsymbol{t}_{\boldsymbol{0}}{ }^{\prime}\right) \boldsymbol{c}=\left\|\vec{V}^{\prime}\right\| \boldsymbol{t}_{\mathbf{1}}{ }^{\prime}+\left\|\vec{V}^{\prime}\right\| \boldsymbol{t}_{2}{ }^{\prime}$ and $\left\|\vec{V}^{\prime}\right\|=\frac{\left(\boldsymbol{t}_{2}{ }^{\prime}-\boldsymbol{t}^{\prime}{ }_{0}\right)}{\boldsymbol{t}_{2}{ }^{\prime}+\boldsymbol{t}_{\mathbf{0}}{ }^{\prime}} \boldsymbol{c}$.
Let $\boldsymbol{M}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ be the transformation matrix from $\mathscr{R}_{4}{ }^{\prime}$ to $\mathscr{R}_{4}$
$\boldsymbol{O}$ has for coordinates $(\boldsymbol{c t}, \mathbf{0}, \mathbf{0}, \mathbf{0})$ in $\mathscr{R}_{4}$,
$\boldsymbol{O}$ will have for coordinates $\left(\boldsymbol{m}_{1, r} \boldsymbol{c t}, \boldsymbol{m}_{2, r} \boldsymbol{c t}, \boldsymbol{m}_{3, r} \boldsymbol{c t}, \boldsymbol{m}_{4, r} \boldsymbol{c t}\right)$ dans $\mathscr{R}_{4}{ }^{\prime}$,
so $\boldsymbol{c t} \boldsymbol{t}^{\prime}=\boldsymbol{m}_{1, r}$. ct and therefore $\|\vec{V}\|=\frac{\left(\boldsymbol{t}^{\prime}{ }_{2}-\boldsymbol{t}^{\prime}{ }_{0}\right)}{\boldsymbol{t}^{\prime}{ }_{2}+\boldsymbol{t}^{\prime}{ }_{0}} . \boldsymbol{c}=\frac{\left(\boldsymbol{t}_{2}-\boldsymbol{t}_{\boldsymbol{0}}\right)}{\boldsymbol{t}_{2}+\boldsymbol{t}_{\boldsymbol{0}}} \cdot \boldsymbol{c}$.
has the same value in $\mathscr{R}^{\prime}$ and $\mathscr{R}$.
The experiment can be seen by the $\mathbf{2}$ observers $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$ as an experiment
 We can therefore speak of the relative speed of 2 frames in uniform translation $\mathscr{R}$ and $\mathscr{R}^{\prime}$ with speed $\vec{V}$ et $-\vec{V}$ and with common module $\|\vec{V}\|$.

Note: (See : N.M.J. Woodhouse. " Special Relativity " •Springer 2002 ) If we consider an observer on $\boldsymbol{O}$ who observes a clock on $\boldsymbol{O}^{\prime}$ which moves away from $\boldsymbol{O}$, with a uniform speed and an observer on $\boldsymbol{O}^{\prime}$ who observes an identical clock on $\boldsymbol{O}$ which moves away from $\boldsymbol{O}^{\prime}$ ' we are in a completely symmetrical situation since we have the same speed in module in the two cases The physical laws being the same in the 2 Galilean frames in uniform translation the coefficient of expansion of the` durations will be the same in the $\mathbf{2}$ measurements made in each of the $\mathbf{2}$ frames. So if we denote $\boldsymbol{N}=\left(\boldsymbol{n}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ the inverse matrix of $\boldsymbol{M}$, knowing that $\boldsymbol{t}^{\prime}=\boldsymbol{m}_{\boldsymbol{1}, 1} \cdot \boldsymbol{t}$ et $\boldsymbol{t}=\boldsymbol{n}_{\boldsymbol{1}, \boldsymbol{1}} \cdot \boldsymbol{t}^{\prime}$, $\boldsymbol{b y}$ what precedes we will have $\boldsymbol{m}_{1, \boldsymbol{1}}=\boldsymbol{n}_{1, \boldsymbol{1}}$.
We will then denote $\gamma$ this common value .

To go further we need:
Lemma: If $\boldsymbol{M}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ is symmetric matrix then : $\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M X}=\mathbf{0}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}\right) \Leftrightarrow \boldsymbol{M}=\mathbf{0}$.
Proof: As M is symmetric M can be diagonalized : $\boldsymbol{M}={ }^{\boldsymbol{t}} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{\Omega}$ where
$\boldsymbol{\Omega}$ is orthogonal and $\mathbf{D}$ diagonal then ${ }^{t} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}={ }^{\boldsymbol{t}} \boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{X}=\mathbf{0}$.
If $\boldsymbol{D}$ is such that $\boldsymbol{d}_{i j}=\mathbf{0}$ for $\boldsymbol{i} \neq \boldsymbol{j}$, and $\boldsymbol{Y}=\boldsymbol{\Omega X}$ then $\sum_{i=1}^{n} d_{i i} \boldsymbol{y}_{i}^{2}=\mathbf{0}, \forall \boldsymbol{Y} \in \mathbb{R}^{n}$,
for $\boldsymbol{Y}=\boldsymbol{e}_{\boldsymbol{i}}$, with $\left(\boldsymbol{e}_{\boldsymbol{i}}\right)_{\boldsymbol{i}=1, \ldots, n}$ the canonical basis of $\mathbb{R}^{\boldsymbol{n}}$, we have
$\boldsymbol{d}_{\boldsymbol{i i}} \cdot \mathbf{1}=\mathbf{0} \Rightarrow \boldsymbol{d}_{\boldsymbol{i i}}=\mathbf{0} \cdot$ We can point out that the result is false
if $\boldsymbol{M}$ is not symmetric : take $\boldsymbol{M}=\left[\begin{array}{cc}0 & 1 \\ -1 & 0\end{array}\right]:{ }^{t} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}=\mathbf{0} \forall \boldsymbol{X} \in \mathbb{R}^{n}$.
But we have the result ( $\left.{ }^{t} \boldsymbol{X M Y}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}, \forall \boldsymbol{Y} \in \mathbb{R}^{\boldsymbol{n}}\right) \Leftrightarrow \boldsymbol{M}=\mathbf{0}$,
since $e_{i} \cdot \boldsymbol{M} \cdot e_{j}=\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}} \cdot$ From this we can deduce again the lemma:
If $\boldsymbol{M}$ is symmetric and if we have $\boldsymbol{X}_{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{X}=\mathbf{0}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}(\mathbf{1})$ then $\forall \boldsymbol{Y} \in \mathbb{R}^{\boldsymbol{n}}{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{Y}=\mathbf{0}$ (2) ,
and therefore ${ }^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{M}(\boldsymbol{X}+\boldsymbol{Y})=\mathbf{0}(\mathbf{3})$,
so ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}+{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{Y}+{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{X}+{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{Y}=\mathbf{0}$ and ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{Y}+{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{X}=\mathbf{0}$.
$\boldsymbol{M}$ being symmtreric and antisymmetric $\boldsymbol{M}=\mathbf{0}$.

Corollary: ${ }^{t}(M X) G(M X), \forall X \in \mathbb{R}^{\boldsymbol{n}} \Leftrightarrow{ }^{\boldsymbol{t}} \boldsymbol{M G M}=\boldsymbol{G}$.
Proof:
${ }^{t}(M X) G(M X)={ }^{t} X^{t} M G M X={ }^{t} X G X, \forall X \in \mathbb{R}^{n} \Leftrightarrow{ }^{t} X\left({ }^{t} M G M-G\right) X=0, \forall X \in \mathbb{R}^{n}$,
$\quad \Leftrightarrow{ }^{t} M G M=G$.
Lemma: (See : N.M.J. Woodhouse. " Special Relativity " •Springer 2002 )
Let $A \in M_{4}(\mathbb{R})$ be a symmetrc matrix and $\boldsymbol{G}=\left[\begin{array}{rrrr}1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1\end{array}\right]$.
Let's assume $\forall \boldsymbol{X}:{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}=\mathbf{0} \Rightarrow{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{A} \boldsymbol{X}=\mathbf{0}$,
then $\exists \alpha \in \mathbb{R}$ suchas $\boldsymbol{A}=\boldsymbol{\alpha} \boldsymbol{G}$.
Proof :
If $\boldsymbol{A}$ is symmetric we can write as :
$A=\left[\begin{array}{cc}\alpha & \boldsymbol{t} \boldsymbol{a} \\ \boldsymbol{a} & S\end{array}\right]$ where $\alpha \in \mathbb{R}, \boldsymbol{a} \in \boldsymbol{M}_{3,1}(\mathbb{R}), S \in \boldsymbol{M}_{3}(\mathbb{R}) \boldsymbol{S}$ symmetric.
We compute for ${ }^{\boldsymbol{t}} \boldsymbol{X}=\left[\boldsymbol{u},{ }^{\boldsymbol{t}} \boldsymbol{Y}\right], \boldsymbol{Y} \in \boldsymbol{M}_{3,1}(\mathbb{R}), \boldsymbol{r} \in \mathbb{R}$ :
${ }^{t} \boldsymbol{X A X}=\left[r^{t} \boldsymbol{Y}\right]\left[\begin{array}{ll}\alpha & \boldsymbol{t}^{\boldsymbol{a}} \\ \boldsymbol{a} & \boldsymbol{S}\end{array}\right]\left[\begin{array}{c}\boldsymbol{r} \\ \boldsymbol{Y}\end{array}\right]=\alpha r^{2}+r^{t} \boldsymbol{Y} \boldsymbol{a}+\boldsymbol{r}^{t} \boldsymbol{a} \boldsymbol{Y}+{ }^{t} \boldsymbol{Y} \boldsymbol{S} \boldsymbol{Y}$ then :
${ }^{t} X M X=\alpha t^{2}+2 r^{t} a Y+{ }^{t} \boldsymbol{Y} S \boldsymbol{S}$. (1)
We note ${ }^{\boldsymbol{t}} \boldsymbol{U}=[\boldsymbol{u}, \boldsymbol{v}, \boldsymbol{w}]$ with $\boldsymbol{u}^{2}+\boldsymbol{v}^{2}+\boldsymbol{w}^{2}=1$ et ${ }^{\boldsymbol{t}} \boldsymbol{X}=[1, \boldsymbol{U}]$
In this case ${ }^{t} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}=\mathbf{0}$ and then ${ }^{t} \boldsymbol{X A} \boldsymbol{X}=\mathbf{0}$,
and (1)can be written with $r=1, \boldsymbol{Y}=\boldsymbol{U}$.
$\boldsymbol{\forall} \boldsymbol{U}$ defined by (2): ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{A} \boldsymbol{X}=\boldsymbol{\alpha}+\mathbf{2}^{\boldsymbol{t}} \boldsymbol{a} \boldsymbol{U}+{ }^{\boldsymbol{t}} \boldsymbol{U} \boldsymbol{S} \boldsymbol{U}=\mathbf{0}$.(3)
If $\boldsymbol{U}$ verifies (3) $\boldsymbol{-} \boldsymbol{U}$ verifies (2) and (3) then:

$$
\alpha+2^{t} a(-U)+^{t}(-U) S(-U)=0
$$

By adding (3) and (4) itfollows:
$\forall \boldsymbol{U}$ defined by $(2): \alpha+{ }^{t} \boldsymbol{U S U}=\mathbf{0} \Leftrightarrow{ }^{t} \boldsymbol{U}\left(\boldsymbol{\alpha I d}_{3}+\boldsymbol{S}\right) \boldsymbol{U}=\mathbf{0}$.
If ${ }^{\boldsymbol{t}} \boldsymbol{U}\left(\boldsymbol{\alpha I d}_{3}+\boldsymbol{S}\right) \boldsymbol{U}=\mathbf{0} \forall \boldsymbol{U}$ defined by (2)
${ }^{\boldsymbol{t}} \boldsymbol{U}\left(\boldsymbol{\alpha I I}_{3}+\boldsymbol{S}\right) \boldsymbol{U}=\mathbf{0}$ is also true for $\forall \boldsymbol{U} \in \mathbb{R}^{3}$.
According to the previous lemma: $\boldsymbol{S}=-\boldsymbol{\alpha} \cdot \boldsymbol{I d}_{\mathbf{3}}$.
By substracting (3) et (4) we have: $\forall \boldsymbol{U}{ }^{\boldsymbol{t}} \boldsymbol{a} \boldsymbol{U}=\mathbf{0} \Rightarrow \boldsymbol{a}=\mathbf{0}$.
Then:
$A=\alpha \cdot\left[\begin{array}{rrrr}\alpha & 0 & 0 & 0 \\ 0 & -\alpha & 0 & 0 \\ 0 & 0 & -\alpha & 0 \\ 0 & 0 & 0 & -\alpha\end{array}\right]=\alpha G$.

This result is a special case of a more general result:
Let be $\boldsymbol{\phi}$ and $\phi^{\prime}$ be two symmetric bilinear forms such the isotropic cone $\mathcal{C}(\phi) \neq\{\boldsymbol{0}\}$
then $\exists \lambda \neq 0 \in \mathbb{R} \phi=\lambda \phi^{\prime} \Leftrightarrow \mathcal{C}(\phi)=\mathcal{C}\left(\phi^{\prime}\right)$.
(cf: R.Goblot."Algébre linéaire "Masson 1995.)
Now we can prove :
Theorem: Let $\boldsymbol{M}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ be the transformation matrix from $\mathscr{R}_{4}{ }^{\prime}$ to $\mathscr{R}_{4}$
Let's assume $\forall \boldsymbol{X}:{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G X}=\mathbf{0} \Rightarrow{ }^{\boldsymbol{t}} \boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M} \boldsymbol{X}=\mathbf{0} \quad(\mathbf{1})$,

$$
\begin{aligned}
(\boldsymbol{M})_{1,1} & =\left(M^{-1}\right)_{1,1} \quad \text { (2) then } \\
{ }^{t} \boldsymbol{M} \boldsymbol{G M} & =\boldsymbol{G}
\end{aligned}
$$

Proof: (cf: $N \cdot M \cdot J \cdot$ Woodhouse •" Special Relativity " •Springer 2002 )
From (1) and the previous lemma, since ${ }^{\boldsymbol{t}} \boldsymbol{M G M}$ is symmetric,
${ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}=\boldsymbol{\alpha} \boldsymbol{G}$ for some $\boldsymbol{\alpha} \in \mathbb{R}, \boldsymbol{\alpha} \neq \mathbf{0}$ since $\boldsymbol{M}$ is non singular.
Hence $\left({ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}\right)^{-1}=(\alpha \boldsymbol{G})^{-1}=\alpha^{-1} \boldsymbol{G}$ and

$$
M^{-1} G=\alpha^{-1} G^{t} M \Rightarrow M^{-1}=\alpha^{-1} G^{t} M G
$$

We have $(\boldsymbol{M})_{1,1}=\left({ }^{\boldsymbol{t}} \boldsymbol{M}\right)_{1,1}=\left(\boldsymbol{M}^{-1}\right)_{1,1}=\left(\alpha^{-1} \boldsymbol{G}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G}\right)_{1,1}$ by (2)
and

$$
\boldsymbol{G}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G}=\left[\begin{array}{rrrr}
1 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 \\
0 & 0 & -1 & 0 \\
0 & 0 & 0 & -1
\end{array}\right] \cdot\left[\begin{array}{llll}
m_{1,1} & m_{1,2} & m_{1,3} & m_{1,4} \\
m_{2,1} & m_{2,2} & m_{2,3} & m_{2,4} \\
m_{3,1} & m_{3,2} & m_{3,3} & m_{3,4} \\
m_{4,1} & m_{4,2} & m_{4,3} & m_{4,4}
\end{array}\right] \cdot\left[\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 \\
0 & 0 & -1 & 0 \\
0 & 0 & 0 & -1
\end{array}\right]
$$

Hence $\left(\boldsymbol{G}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G}\right)_{1,1}=\boldsymbol{m}_{1,1}$ and $\boldsymbol{\alpha}=\mathbf{1}$.
Note: (1) is a consequence of the invariance of the light cone.
For (2) see the previous note.

## (4)Lorentz matrix study:

We start by giving the general properties of Lorentz matrices then we give an estimation of each term of these matrices.
(We note ${ }^{\boldsymbol{t}} \boldsymbol{X}$ and ${ }^{\boldsymbol{t}} \boldsymbol{M}$ the transpose of the column vector $\boldsymbol{X}$ and the matrix $\boldsymbol{M}$ ).
Introduction :
Let $\boldsymbol{\Phi}(\boldsymbol{X})=\boldsymbol{x}_{1}{ }^{2}-\sum_{i=2}^{n} \boldsymbol{x}_{i}{ }^{2}$ with $\left({ }^{t} \boldsymbol{X}=\left(\boldsymbol{x}_{1}, \ldots, \boldsymbol{x}_{\boldsymbol{n}}\right)\right)$ be the quadratic Lorentz
form and let $\boldsymbol{G}$ be the matrice $\left[\begin{array}{lll}1 & & { }^{\boldsymbol{t}} \boldsymbol{0} \\ 0 & -\boldsymbol{I d} & \\ & & \mathbb{R}^{n-1}\end{array}\right]$ where $\mathbf{0}$ is the zero-column of $\mathbb{R}^{n-1}$ :
$\boldsymbol{\Phi}(X)={ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G X} \quad \forall X \in \mathbb{R}^{\boldsymbol{n}}$.
We seek the matrices $\boldsymbol{M}$ such
$\boldsymbol{\Phi}(\boldsymbol{M X})=\boldsymbol{\Phi}(\boldsymbol{X}) \Leftrightarrow^{\boldsymbol{t}}(\boldsymbol{M X}) \boldsymbol{G}(\boldsymbol{M X})=^{\boldsymbol{t}} \boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{M G M X}={ }^{\boldsymbol{t}} \boldsymbol{X G X}, \forall X \in \mathbb{R}^{\boldsymbol{n}}$.

Lemma : If $\boldsymbol{M}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ is symmetric then : $\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}=\mathbf{0}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}\right) \Leftrightarrow \boldsymbol{M}=\mathbf{0}$.
Proof : As M is symmetric $\boldsymbol{M}$ can be diagonalized : $\boldsymbol{M}=\boldsymbol{=} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{\Omega}$ where
$\boldsymbol{\Omega}$ is orthogonal and $\boldsymbol{D}$ diagonal then ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}={ }^{\boldsymbol{t}} \boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{X}=\boldsymbol{0}$.
If $\boldsymbol{D}$ is such that $\boldsymbol{d}_{i j}=\mathbf{0}$ for $\boldsymbol{i} \neq \boldsymbol{j}$, and $\boldsymbol{Y}=\boldsymbol{\Omega X}$ then $\sum_{i=1}^{n} \boldsymbol{d}_{i \boldsymbol{i}} \boldsymbol{y}_{\boldsymbol{i}}^{2}=\mathbf{0}, \forall \boldsymbol{Y} \in \mathbb{R}^{n}$,
for $\boldsymbol{Y}=\boldsymbol{e}_{\boldsymbol{i}}$, with $\left(\boldsymbol{e}_{\boldsymbol{i}}\right)_{\boldsymbol{i}=1, \ldots, n}$ the canonical basis of $\mathbb{R}^{\boldsymbol{n}}$, we have
$\boldsymbol{d}_{i \boldsymbol{i}} \cdot \mathbf{1}=\mathbf{0} \Rightarrow \boldsymbol{d}_{\boldsymbol{i i}}=\mathbf{0} \cdot$ We can point out that the result is false
if $\boldsymbol{M}$ is not symmetric : take $\boldsymbol{M}=\left[\begin{array}{cc}0 & 1 \\ -1 & 0\end{array}\right]:^{t} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}=\mathbf{0} \quad \forall \boldsymbol{X} \in \mathbb{R}^{n}$.
But we have the result ( $\left.{ }^{t} \boldsymbol{X M Y}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}, \forall \boldsymbol{Y} \in \mathbb{R}^{\boldsymbol{n}}\right) \Leftrightarrow \boldsymbol{M}=\mathbf{0}$,
since $\boldsymbol{e}_{\boldsymbol{i}} \cdot \boldsymbol{M} \cdot \boldsymbol{e}_{\boldsymbol{j}}=\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}} \cdot$ From this we can deduce again the lemma :
If $\boldsymbol{M}$ is symmetric and if we have $\boldsymbol{t}^{\boldsymbol{X}} \boldsymbol{M X}=\mathbf{0}, \forall \boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}$ (1) then $\forall \boldsymbol{Y} \in \mathbb{R}^{\boldsymbol{n}}{ }^{\boldsymbol{t}} \boldsymbol{Y M Y}=\mathbf{0}(\mathbf{2})$, and therefore ${ }^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{M}(\boldsymbol{X}+\boldsymbol{Y})=\mathbf{0}(\mathbf{3})$,
so $\boldsymbol{}^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{X}+{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{Y}+{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{X}+{ }^{\boldsymbol{t}} \boldsymbol{Y M Y}=\mathbf{0}$ and ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{M} \boldsymbol{Y}+{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{M} \boldsymbol{X}=\mathbf{0}$.
$\boldsymbol{M}$ being symmtreric and antisymmetric $\boldsymbol{M}=\mathbf{0}$.
Corollary: ${ }^{\boldsymbol{t}}(\boldsymbol{M X}) \boldsymbol{G}(\boldsymbol{M X}), \forall X \in \mathbb{R}^{\boldsymbol{n}} \Leftrightarrow{ }^{\boldsymbol{t}} \boldsymbol{M G M}=\boldsymbol{G}$.
Proof:

$\Leftrightarrow^{t} \boldsymbol{M G M}=\boldsymbol{G}$.

## Definition:

If $\boldsymbol{M}$ is such ${ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}=\boldsymbol{G}, \boldsymbol{M}$ is called a Lorentz matrix .

## Theorem 1:

The Lorentz matrices form a subgroup $\boldsymbol{L}$ of $\boldsymbol{G L}_{\boldsymbol{n}}(\mathbb{R})$, group of the invertible matrices of dimension $\boldsymbol{n}$.

$$
\begin{aligned}
& \Rightarrow\left\{\begin{array}{c}
\left.I_{\mathbb{R}^{n}}\right\}
\end{array}\right\} \subseteq L \subseteq G L_{n}(\mathbb{R}) . \\
& \text { (2) }{ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}=\boldsymbol{G} \Rightarrow \boldsymbol{G}=\boldsymbol{G}^{-1}=\boldsymbol{M}^{-1} \boldsymbol{G}^{(t} \boldsymbol{M}^{-1}=M^{-1} \boldsymbol{G}^{\boldsymbol{t}}\left(M^{-1}\right) \text {. } \\
& \text { (3) If } \boldsymbol{M} \in \boldsymbol{L} \text { and } \boldsymbol{N} \in \boldsymbol{L} \text {, we have }{ }^{\boldsymbol{t}}(\boldsymbol{M N}) \boldsymbol{G}(\boldsymbol{M N})={ }^{\boldsymbol{t}} \boldsymbol{N}\left({ }^{\boldsymbol{t}} \boldsymbol{M G M}\right) \boldsymbol{N}=\boldsymbol{G} \text {. }
\end{aligned}
$$

From (1), (2) and (3) we can infer the theorem.
Corollary:
${ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G} M=\boldsymbol{G} \Rightarrow \boldsymbol{M}^{-1}=\boldsymbol{G}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G}=\left[\begin{array}{cccc}\boldsymbol{m}_{1,1} & -\boldsymbol{m}_{2,1} & -\boldsymbol{m}_{3,1} & -\boldsymbol{m}_{4,1} \\ -\boldsymbol{m}_{1,2} & \boldsymbol{m}_{2,2} & \boldsymbol{m}_{3,2} & \boldsymbol{m}_{4,2} \\ -\boldsymbol{m}_{1,3} & \boldsymbol{m}_{2,3} & \boldsymbol{m}_{3,3} & \boldsymbol{m}_{4,3} \\ -\boldsymbol{m}_{1,4} & \boldsymbol{m}_{2,4} & \boldsymbol{m}_{3,4} & \boldsymbol{m}_{4,4}\end{array}\right]$ if $\boldsymbol{M}=\left(\boldsymbol{m}_{i, j}\right)$.
A Lorentz matrix being invertible by (1), M has a unique polar decomposition:
$\boldsymbol{M}=\boldsymbol{S O}, \boldsymbol{S}$ symmetric and definite positive, $\boldsymbol{O}$ orthogonal.
We refer to a classical theorem : (theorem of decomposition)
Any invertible matrix $\boldsymbol{A}$ can be written, in a unique way, as a product: $\boldsymbol{A}=\boldsymbol{S O}=\boldsymbol{O}_{\boldsymbol{1}} \boldsymbol{S}_{\boldsymbol{1}}$,
where $\boldsymbol{S}, \boldsymbol{S}_{1}$ are positive definite symmetric matrices, $\boldsymbol{O}, \boldsymbol{O}_{1}$ are orthogonal matrices,
here : $\boldsymbol{S}=\sqrt{\boldsymbol{t}_{\boldsymbol{A} \boldsymbol{A}}}, \boldsymbol{S}=\sqrt{\boldsymbol{A}^{\boldsymbol{t} \boldsymbol{A}}}$.
(Cf. F.R.Gantmacher: Theory of matrices. AMS Chelsea Publishing 1959).
In the case of $\boldsymbol{L}$ we can be more specific .
For that we need some lemmas.
(Cf. J-M. Souriau."Calcul Linéaire " •PUF 1964 or $J \cdot G a b a y ~ 2000) ~$

## Lemma 1:

Let $\boldsymbol{X} \in \mathbb{R}^{\boldsymbol{n}}$ be such that ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{X}=\mathbf{1} \cdot$ Let $\boldsymbol{N}$ the matrix define by :
$\mathcal{O}_{n-1}$ being the null matrix of $\mathbb{M}_{n-1}(\mathbb{R})$,

$$
N=\left[\begin{array}{cc}
0 & \\
\boldsymbol{O}_{\boldsymbol{X}} \\
\boldsymbol{X} & \mathcal{O}_{n-1}
\end{array}\right] \text {. Then we have } \forall \alpha \in \mathbb{R}:
$$

$M=\exp (\alpha N)=\left[\begin{array}{rr}\operatorname{ch}(\alpha) & \operatorname{sh}(\alpha)^{t} X \\ \operatorname{sh}(\alpha) X & \left(I d_{\mathbb{R}^{n}-1}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)\end{array}\right]$
is a Lorentz matrice of $\mathbb{M}_{\boldsymbol{n}}(\mathbb{R})$ such as $\operatorname{det}(\boldsymbol{M})=1$ and its eingenvalues are strictly positive.
In short M is a definite positive symmetric Lorentz matrix.
Proof: We have $\boldsymbol{N}^{2}=\left[\begin{array}{cc}1 & 0 \\ 0^{n-1} & X^{t} \boldsymbol{X}\end{array}\right] 0^{n-1}$ being the zero-column of dimension $n-1$,
since ${ }^{t} \boldsymbol{X} \boldsymbol{X}=\boldsymbol{1}$ and $\left(\boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{X}\right)\left(\boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{X}\right)=\boldsymbol{X}\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{X}\right)^{\boldsymbol{t}} \boldsymbol{X}$ we have $\boldsymbol{N}^{\mathbf{3}}=\boldsymbol{N}$.
We can notice that for all square matrix $\boldsymbol{A}$ and for all $\alpha \in \mathbb{R}$,
$\exp (A)=\sum_{n=0}^{+\infty} \frac{A^{n}}{n!}, \operatorname{sh}(\alpha)=\sum_{n=0}^{+\infty} \frac{\alpha^{2 n+1}}{(2 n+1)!}, \operatorname{ch}(\alpha)=\sum_{n=0}^{+\infty} \frac{\alpha^{2 n}}{(2 n)!}$,
therefore $\exp (\alpha N)=I d_{\mathbb{R}^{4}}+\alpha N+\frac{\alpha^{2} N^{2}}{2!}+\frac{\alpha^{3} N}{3!}+\frac{\alpha^{4} N^{2}}{4!}+\ldots \ldots+$

$$
\begin{aligned}
& =I d_{\mathbb{R} n}+\operatorname{sh}(\alpha) N+(\operatorname{ch}(\alpha)-1) N^{2} \\
& =\left[\begin{array}{lll}
1 & 0 & 0 \\
1 & 1 & 1 \\
0 & 0 & 1
\end{array}\right]+\left[\begin{array}{cc}
0 & \operatorname{sh}(\alpha)^{t} X \\
\operatorname{sh}(\alpha) X & \mathcal{O}_{n-1}
\end{array}\right]+\left[\begin{array}{cc}
(\operatorname{ch}(\alpha)-1) & 0 \\
0^{n-1} & (\operatorname{ch}(\alpha)-1) X_{X}^{t}
\end{array}\right] \text { which shows (1) . }
\end{aligned}
$$

Now let's show that $\boldsymbol{M}$ is of Lorentz that is to say ${ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G} \boldsymbol{M}=\boldsymbol{G}$.
We can remark that $\boldsymbol{M}$ is symmetric and with $\boldsymbol{I d}=\boldsymbol{I d} \boldsymbol{D}_{\mathbb{R} \boldsymbol{n}}-\mathbf{1}$

$$
\left[\begin{array}{lr}
\operatorname{ch}(\alpha) & \operatorname{sh}(\alpha) X \\
\operatorname{sh}(\alpha) X & (I d+(\operatorname{ch}(\alpha)-1) X X)
\end{array}\right]\left[\begin{array}{lll}
1 & & t^{t} 0^{n-1} \\
& 0^{n-1} & -I d
\end{array}\right]=\left[\begin{array}{cc}
\operatorname{ch}(\alpha) & -\operatorname{sh}(\alpha) X \\
\operatorname{sh}(\alpha) X & -(I d+(\operatorname{ch}(\alpha)-1) X X)
\end{array}\right]
$$

and
$\left[\begin{array}{lr}\operatorname{ch}(\alpha) & -\operatorname{sh}(\alpha) X X \\ \operatorname{sh}(\alpha) X & -(I d+(\operatorname{ch}(\alpha)-1) X X)\end{array}\right]\left[\begin{array}{cc}\operatorname{ch}(\alpha) & \operatorname{sh}(\alpha) X \\ (\operatorname{sh}(\alpha)) X & (I d+(\operatorname{ch}(\alpha)-1) X X)\end{array}\right]=\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$.
Let us estimate $\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}, \boldsymbol{d}$.

$$
\begin{aligned}
& a=\operatorname{ch}^{2}(\alpha)-\operatorname{sh}^{2}(\alpha){ }^{t} X X=1, \operatorname{since}{ }^{t} X X=1 . \\
& b=\operatorname{ch}(\alpha) \operatorname{sh}(\alpha)^{t} X-\operatorname{sh}(\alpha)^{t} X\left(I d d_{\mathbb{R}-1}+(\operatorname{ch}(\alpha)-1) X^{t} X\right) \\
& =\operatorname{ch}(\alpha) \operatorname{sh}(\alpha)^{t} X-\operatorname{sh}(\alpha)^{t} X-\operatorname{sh}(\alpha)(\operatorname{ch}(\alpha)-1){ }^{t} X X^{t} X \\
& =\operatorname{ch}(\alpha) \operatorname{sh}(\alpha)^{t} X-\operatorname{sh}(\alpha)^{t} X-\operatorname{sh}(\alpha) \operatorname{ch}(\alpha) X^{t} X+\operatorname{sh}(\alpha)^{t} X=0, \\
& c=\operatorname{ch}(\alpha) \operatorname{sh}(\alpha) X-\left(I d \mathbb{R}^{n}-1+(\operatorname{ch}(\alpha)-1) X^{t} X\right) \operatorname{sh}(\alpha) X \\
& =\operatorname{ch}(\alpha) \operatorname{sh}(\alpha) X-\operatorname{sh}(\alpha) X-\operatorname{sh}(\alpha)(\operatorname{ch}(\alpha)-1) X=0, \\
& d=\operatorname{sh}^{2}(\alpha) X^{t} X-\left(I d \mathbb{R}^{n-1}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)^{2} \quad b u t:
\end{aligned}
$$

$$
\left(I_{\mathbb{R}^{n-1}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)\left(I_{\mathbb{R}^{n-1}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)
$$

$$
=I d \mathbb{R}^{n-1}+(\operatorname{ch}(\alpha)-1) X^{t} X+(\operatorname{ch}(\alpha)-1) X^{t} X+(\operatorname{ch}(\alpha)-1)^{2} X^{t} X X^{t} X
$$

since ${ }^{t} \boldsymbol{X} \boldsymbol{X}=1$ then $\boldsymbol{X}\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{X}\right)^{\boldsymbol{t}} \boldsymbol{X}=\boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{X}$ (association of matrix product),
et $(\operatorname{ch}(\alpha)-1)^{2}=\operatorname{ch}^{2}(\alpha)-2 \operatorname{ch}(\alpha)+1$
$=I d_{\mathbb{R} n-1}+\left(2(\operatorname{ch}(\alpha)-1)+\operatorname{ch}^{2}(\alpha)-2 \operatorname{ch}(\alpha)+1\right) X^{t} X$
$=I d_{\mathbb{R}^{n-1}}+\left(\operatorname{ch}^{2}(\alpha)-1\right) X^{t} X=I d_{\mathbb{R}^{n}-1}+\operatorname{sh}^{2}(\alpha) X^{t} X$
finally :
$\operatorname{sh}^{2}(\alpha) X^{t} X-\left(I_{\mathbb{R} n-1}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)^{2}=-I d_{\mathbb{R}^{n-1}}$.
Therefore $\left[\begin{array}{l}\boldsymbol{a} \\ \boldsymbol{c}\end{array}\right.$

$$
\left.\begin{array}{l}
b \\
d
\end{array}\right]=\left[\begin{array}{llr}
1 & & t_{0} \\
0 & -I_{\mathbb{R} n-1}
\end{array}\right]
$$

and M is of Lorentz.
Another proof possible is :

$$
\begin{aligned}
& \exp (\alpha N) G=\left[\begin{array}{cr}
\operatorname{ch}(\alpha) & \operatorname{sh}(\alpha)^{t} X \\
\operatorname{sh}(\alpha) X & \left(I d_{\mathbb{R}^{n-1}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)
\end{array}\right]\left[\begin{array}{ll}
1 & t_{0} \\
0 & -I d \mathbb{R}^{n-1}
\end{array}\right] \\
& =\left[\begin{array}{rr}
\operatorname{ch}(\alpha) & -s h(\alpha)^{t} X \\
\operatorname{sh}(\alpha) X & -\left(I_{\mathbb{R}^{n-1}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)
\end{array}\right], \\
& \operatorname{Gexp}(-\alpha N)=\left[\begin{array}{rrr}
1 & & t_{0} \\
0 & -I d_{\mathbb{R} n-1}
\end{array}\right]\left[\begin{array}{ll}
\operatorname{ch}(\alpha) & -s h(\alpha)^{t} X \\
-\operatorname{sh}(\alpha) X & \left(I d_{\mathbb{R}^{n-1}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)
\end{array}\right]
\end{aligned}
$$

$=\left[\begin{array}{lr}\operatorname{ch}(\alpha) & -\operatorname{sh}(\alpha)^{t} X \\ \operatorname{sh}(\alpha) X & -\left(I_{\mathbb{R}^{n}-1}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)\end{array}\right]$
therefore $\exp (\alpha N) G=G \exp (-\alpha N) \Rightarrow \exp (\alpha N) G \exp (\alpha N)=G$
as $\boldsymbol{M}=\exp (\alpha N)$ est symétrique ${ }^{t} \mathbf{M G M}=\boldsymbol{G}$ et $\boldsymbol{M}$ est de Lorentz.
For a third demonstration see :J-M. Souriau."Calcul Linéaire " •PUF 1964 or $J$ •Gabay 2000.

Let us now show that $\operatorname{det}(\boldsymbol{\operatorname { e x p }}(\boldsymbol{A}))=\boldsymbol{e}^{\boldsymbol{T r}(\boldsymbol{A})}$ for $\boldsymbol{A} \in \boldsymbol{M}_{\boldsymbol{n}}(\mathbb{R})$ :
Let us consider $\boldsymbol{A}$ as an element of $\boldsymbol{M}_{\boldsymbol{n}}(\mathbb{C}) . \boldsymbol{A}$ is then trigonalisable
and can be written : $\boldsymbol{A}=\boldsymbol{P}^{-1} \boldsymbol{B} \boldsymbol{P}$, with $\boldsymbol{B}$ upper triangular whose diagonal is composed of the eigenvalues $\lambda_{\boldsymbol{i}}$ of $\boldsymbol{A}$.
By relying on the definition of the exponential of a matrix we can write $\exp (\boldsymbol{A})=\boldsymbol{P}^{-1} \exp (\boldsymbol{B}) P$.
By expanding $\exp (\boldsymbol{B})$ into series and by noticing that $\boldsymbol{B}^{\boldsymbol{k}}$ is upper triangular $\forall \boldsymbol{k} \geq \boldsymbol{1}$.
Then $\exp (\boldsymbol{B})$ has for diagonal the $\boldsymbol{e}^{\lambda_{i}}>0$. Therefore
$\operatorname{det}(\exp (A))=\operatorname{det}(\exp (B))=\prod_{i} e^{\lambda_{i}}=e^{\sum_{i}^{\lambda_{i}}}=e^{\operatorname{Tr}(A)}$.
Let's go back to $\exp (\alpha N)$ :
As $\boldsymbol{\alpha N}$ is a zero - trace matrix: $\operatorname{det}(\boldsymbol{M})=\operatorname{det}(\exp (\alpha N))=1$ and the eingenvalues of $M=\exp (\alpha N)$ arestrictly positive.

## Lemma 2:

If $\boldsymbol{M}$ is a matrix of Lorentz whose first column $\boldsymbol{K}_{\boldsymbol{1}}$ is
of the form : $\boldsymbol{K}_{\boldsymbol{1}}={ }^{\boldsymbol{t}}(\boldsymbol{\alpha}, \mathbf{0}, \ldots, \boldsymbol{0})$ then $\boldsymbol{M}$ is of the form :
$\boldsymbol{M}=\left[\begin{array}{cc}\varepsilon & { }^{\boldsymbol{t}} \boldsymbol{Q} \\ \boldsymbol{Q} & \boldsymbol{\Omega}\end{array}\right] \quad \boldsymbol{\varepsilon}= \pm \mathbf{1},{ }^{\boldsymbol{t}} \boldsymbol{Q}=(\mathbf{0}, 0,0),{ }^{\boldsymbol{t}} \Omega \Omega=\boldsymbol{I} \boldsymbol{d}_{\mathbb{R} n-1}(\boldsymbol{1})$.
Conversely any matrix of this form is of Lorentz.
Proof:
Let $\quad \boldsymbol{M}=\left[\begin{array}{ll}\alpha & { }^{t} \boldsymbol{L} \\ 0 & \boldsymbol{C}\end{array}\right]$ with $\boldsymbol{C} \in \mathbb{M}_{3}(\mathbb{R}),{ }^{\boldsymbol{t}} \boldsymbol{L}=\left(\boldsymbol{l}_{1}, \boldsymbol{l}_{2}, l_{3}\right)$.
As $\left({ }^{\boldsymbol{t}} \boldsymbol{M G}\right) \boldsymbol{M}=\boldsymbol{G}$ we have:

$$
\begin{aligned}
G & =\left[\begin{array}{cc}
\alpha & 0 \\
L & -C
\end{array}\right]\left[\begin{array}{ll}
\alpha & L^{t} \\
0 & C
\end{array}\right] \\
& =\left[\begin{array}{lr}
\alpha^{2} & \alpha^{t} L \\
\alpha L & L^{t} L-{ }^{t} C C
\end{array}\right]
\end{aligned}
$$

by identification $\alpha= \pm \mathbf{1}, L=\mathbf{0},{ }^{\boldsymbol{t}} \mathbf{C C}=\boldsymbol{I d}_{\mathbb{R}^{\boldsymbol{n}-1}}$.
Conversely: $\left[\begin{array}{cc}\boldsymbol{\varepsilon} & { }^{\boldsymbol{t}} \boldsymbol{Q} \\ \boldsymbol{Q} & { }^{\boldsymbol{t}} \boldsymbol{\Omega}\end{array}\right] \boldsymbol{G}\left[\begin{array}{cc}\boldsymbol{\varepsilon} & { }^{\boldsymbol{t}} \boldsymbol{Q} \\ \boldsymbol{Q} & \boldsymbol{\Omega}\end{array}\right]=\boldsymbol{G}$.

## Theorem:

Everymatrix M of Lorentz can be put in the form :

$$
M=\exp (\alpha N) \cdot\left[\begin{array}{ll}
\varepsilon & 0 \\
0 & \Omega
\end{array}\right] \text { with } \alpha \in \mathbb{R}, \varepsilon= \pm 1
$$

This polar decomposition is unique .
Proof:
Let $\boldsymbol{M}$ be a matrix of Lorentz $\boldsymbol{M}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{j}}\right)$ and $\boldsymbol{M}_{\boldsymbol{1}}$ the first column of $\boldsymbol{M}$.
If $\boldsymbol{M}_{\boldsymbol{1}}=\left(\boldsymbol{m}_{\boldsymbol{i}, \boldsymbol{1}}\right)$ then:

$$
{ }^{t} M_{1} G M_{1}=m_{1,1}^{2}-m_{1,2}^{2}-\ldots-m_{1, n}^{2}=G_{1,1}=1
$$

We write ${ }^{\boldsymbol{t}} \boldsymbol{M}_{1}=(\beta, \boldsymbol{Y})$ with $\boldsymbol{\beta}=\boldsymbol{m}_{1,1}$ and ${ }^{\boldsymbol{t}} \boldsymbol{Y}=\left(\boldsymbol{m}_{1,2}, \ldots, \boldsymbol{m}_{1, n}\right)$.
Therefore $\beta^{2}-{ }^{t} \boldsymbol{Y} \boldsymbol{Y}=1$ and $|\beta| \geq 1$ - We can write $\beta=\boldsymbol{\varepsilon} \cdot \operatorname{ch}(\alpha)$ with $\varepsilon= \pm 1$ and $\alpha \in \mathbb{R}$.Moreover ${ }^{t} \boldsymbol{Y Y}=\beta^{2}-1=\operatorname{sh}^{2}(\alpha)$.
If $\alpha \neq 0$ put $\boldsymbol{X}=\frac{\boldsymbol{Y}}{\boldsymbol{\varepsilon} \cdot \boldsymbol{\operatorname { s h }}(\alpha)}$, we have ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{X}=1$.

If $\boldsymbol{\alpha}=\mathbf{0}$ on a ${ }^{\boldsymbol{t}} \boldsymbol{M}_{\mathbf{1}}=(\boldsymbol{\varepsilon}, \mathbf{0}, \mathbf{0}, 0)$.
In all cases ${ }^{t} M_{1}=\varepsilon(\operatorname{ch}(\alpha), \operatorname{sh}(\alpha) X)$ avec $^{t} X X=1$.
$\boldsymbol{M}_{1}$ is the first column of $\boldsymbol{\varepsilon} \cdot \boldsymbol{\operatorname { e x p }}(\boldsymbol{\alpha N})$ with $\boldsymbol{N}=\left[\begin{array}{lc}\boldsymbol{0} & { }^{\boldsymbol{t}} \boldsymbol{X} \\ \boldsymbol{X} & \boldsymbol{O}\end{array}\right]$.
$\exp (-\alpha N) \cdot M$ is a matrix of Lorentz since $M$ and $\exp (-\alpha N)$ are of Lorentz (lemma 1$)$. Let's estimate the first column $\boldsymbol{K}_{1}$ of this product :

$$
K_{I}=\left[\begin{array}{lr}
\operatorname{ch}(\alpha) & (\operatorname{sh}(-\alpha))^{t} X \\
(\operatorname{sh}(-\alpha)) X & I_{\mathbb{R}^{3}}+(\operatorname{ch}(\alpha)-1) X^{t} X
\end{array}\right] \cdot M_{I}
$$

${ }^{t} X X=1, \operatorname{ch}^{2}(\alpha)-\operatorname{sh}^{2}(\alpha)=1$ and
$\left(\boldsymbol{I d}_{\mathbb{R}^{\mathbf{B}}}+(\operatorname{ch}(\alpha)-\boldsymbol{1}) \boldsymbol{X}^{\boldsymbol{t}} \boldsymbol{X}\right) \cdot \boldsymbol{X}=\boldsymbol{c h}(\alpha) \cdot \boldsymbol{X} \quad$ since $\left(\boldsymbol{X}^{t} \boldsymbol{X}\right) \boldsymbol{X}=\boldsymbol{X}\left({ }^{t} \boldsymbol{X} \boldsymbol{X}\right)$
We have $:{ }^{\boldsymbol{t}} \boldsymbol{K}_{\mathbf{1}}=(\boldsymbol{\varepsilon}, \mathbf{0}, \ldots, 0) \cdot$ The lemma $\mathbf{2}$ implies:

$$
M=\exp (\alpha N) \cdot\left[\begin{array}{ll}
\varepsilon & 0 \\
0 & \Omega
\end{array}\right]
$$

$\boldsymbol{\alpha} \boldsymbol{N}$ being a symmetric matrix, it is a diagonalizable matrix : $\boldsymbol{\alpha} \boldsymbol{N}=^{\boldsymbol{t}} \boldsymbol{P} \boldsymbol{D P P}$, with $\boldsymbol{D}$ a diagonal matrix and $\mathbf{P}$ an orthogonal matrix :
therefore $\exp (\alpha N)=\exp \left({ }^{\boldsymbol{t}} \boldsymbol{P D P}\right)=^{\boldsymbol{t}} \boldsymbol{\operatorname { P e x p }}(\boldsymbol{D}) \boldsymbol{P}$ and $\exp (\alpha N)$ is a definite positive matrix.
Moreover $\left[\begin{array}{cc}\varepsilon & 0 \\ 0 & { }^{t} \Omega\end{array}\right]\left[\begin{array}{cc}\varepsilon & 0 \\ 0 & \Omega\end{array}\right]=\boldsymbol{I d}_{\mathbb{P} \boldsymbol{i}}$.
We have decompozed $\boldsymbol{M}$ into an product of a definite positive symmetric matrix and an orthogonal one, by the theorem of decomposition, there is uniqueness.

Note:
(1)If $\boldsymbol{n}=\mathbf{2}$ then $\boldsymbol{\Omega}=\mathbf{1}$ and if $\boldsymbol{\Omega} \cdot \boldsymbol{\varepsilon}=\mathbf{1}$ then $\boldsymbol{M}$ is symmetric.

If $n=3$ then $\Omega=\left[\begin{array}{cc}\boldsymbol{\operatorname { c o s }}(\theta) & -\boldsymbol{\operatorname { s i n } ( \theta )} \\ \sin (\theta) & \cos (\theta)\end{array}\right]$ or $\Omega=\left[\begin{array}{cc}\boldsymbol{\operatorname { c o s }}(\varphi) & \sin (\varphi) \\ \boldsymbol{\operatorname { s i n }}(\varphi) & -\boldsymbol{\operatorname { c o s } ( \varphi )}\end{array}\right]$ with $\theta \in \mathbb{R}, \varphi \in \mathbb{R}$.
If $\boldsymbol{n}=4$ then $\Omega$ is a spatial rotation if $\operatorname{det}(\Omega)=+1$.
If not $\Omega$ is a reflection, or a combination of a rotation and a reflection.
(2) Let's consider ${ }^{\boldsymbol{t}} \boldsymbol{W}^{\prime}=\left(\boldsymbol{c} \boldsymbol{t}^{\prime}, \mathbf{0}, \mathbf{0}, \mathbf{0}\right)$ with $\boldsymbol{c}$ a constant, $\boldsymbol{t}$ ' a real variable $>\boldsymbol{0}$ and let $\boldsymbol{W}=\boldsymbol{M} \boldsymbol{W}^{\prime}$.

Let 's assume that ${ }^{\boldsymbol{t}} \boldsymbol{W}$ can be written in the form : ${ }^{\boldsymbol{t}} \boldsymbol{W}=\left(\boldsymbol{c t}, \boldsymbol{c t} \boldsymbol{\beta}_{\boldsymbol{1}}, \boldsymbol{c t} \boldsymbol{\beta}_{\boldsymbol{2}}, \boldsymbol{c t} \boldsymbol{\beta}_{3}\right)$
with $\beta_{1}, \beta_{2}, \beta_{3}$ real constants, $\boldsymbol{t}$ a real variable.

If $\boldsymbol{M}=\left[\begin{array}{cc}\gamma & (\overrightarrow{\boldsymbol{\gamma}}) \\ \overrightarrow{\gamma \beta} & C\end{array}\right]\left[\begin{array}{cc}\boldsymbol{\varepsilon} & \boldsymbol{0} \\ \boldsymbol{0} & \boldsymbol{\Omega}\end{array}\right]$ then $\boldsymbol{t}=\boldsymbol{\varepsilon} \cdot \boldsymbol{\gamma} \cdot \boldsymbol{t}^{\prime}$ and $\boldsymbol{\varepsilon}=\frac{\boldsymbol{t} \cdot \boldsymbol{t}^{\prime}}{\left|\boldsymbol{t} \cdot \boldsymbol{t}^{\prime}\right|}$.
Now, we are going to explicit $\boldsymbol{M}$ in the case of the special relativity :
Lemma 3:
Let $\boldsymbol{M}$ be a matrix of Lorentz with $\boldsymbol{n}=\mathbf{4}, \boldsymbol{\varepsilon}=\mathbf{1}$ and let's consider ${ }^{\boldsymbol{t}} \boldsymbol{W}^{\boldsymbol{\prime}}=\left(\boldsymbol{c} \boldsymbol{t}^{\prime}, \mathbf{0}, \mathbf{0}, \mathbf{0}\right)$ with $\boldsymbol{c}$ a constant, $\boldsymbol{t}^{\prime}>\mathbf{0}$ a real variable and let $\boldsymbol{W}=\boldsymbol{M} \boldsymbol{W}^{\prime}$.
Let 's assume that ${ }^{\boldsymbol{t}} \boldsymbol{W}$ can be written in the form :
${ }^{t} \boldsymbol{W}=\left(\boldsymbol{c t}, \boldsymbol{c t} \boldsymbol{\beta}_{\boldsymbol{1}}, c t \boldsymbol{\beta}_{2}, c t \boldsymbol{\beta}_{3}\right)$ with $\boldsymbol{\beta}_{1}, \boldsymbol{\beta}_{2}, \boldsymbol{\beta}_{3}$ real constants, $\boldsymbol{t}$ a real variable.
Then if $\boldsymbol{M}=\exp (\alpha \boldsymbol{N}) \cdot\left[\begin{array}{cc}1 & 0 \\ \boldsymbol{0} & \boldsymbol{\Omega}\end{array}\right]$, with $\boldsymbol{N}=\left[\begin{array}{cc}\boldsymbol{0} & { }^{\boldsymbol{t}} \boldsymbol{X} \\ \boldsymbol{X} & \mathcal{O}_{n-1}\end{array}\right]$ and $\mathcal{O}_{\boldsymbol{n}-1}$ the null matrix then
if we write $\overrightarrow{\boldsymbol{\beta}}={ }^{t}\left(\boldsymbol{\beta}_{1}, \boldsymbol{\beta}_{2}, \boldsymbol{\beta}_{3}\right)$ and $\overrightarrow{\boldsymbol{X}}={ }^{t}\left(\boldsymbol{X}_{1}, \boldsymbol{X}_{2}, \boldsymbol{X}_{3}\right)$,
we have $\exp (\alpha N)=\left[\begin{array}{cc}\gamma & { }^{t}(\overrightarrow{\gamma \beta}) \\ \overrightarrow{\gamma \beta} & C\end{array}\right]$ and then $M=\left[\begin{array}{cc}{ }^{\gamma} & { }^{t}(\overrightarrow{\gamma \beta}) \boldsymbol{\Omega} \\ \overrightarrow{\gamma \beta} & C \Omega\end{array}\right]$,
with $\quad C=\left[\begin{array}{ccc}1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{1}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{3} \\ \frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{2}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{3} \\ \frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{3}^{2}\end{array}\right]$,
$\vec{\beta}=\operatorname{th}(\alpha) \vec{X}$ and $\gamma=\operatorname{ch}(\alpha)$.
Proof:
First we can point out that $\left[\begin{array}{cc}1 & 0 \\ 0 & \Omega\end{array}\right] \boldsymbol{W}^{\prime}=\boldsymbol{W}^{\prime}$ donc $\boldsymbol{W}=\exp (\alpha N) \boldsymbol{W}^{\prime}$.
We have to solve :

$$
\left[\begin{array}{lr}
\operatorname{ch}(\alpha) & \operatorname{sh}(\alpha)^{t} X \\
\operatorname{sh}(\alpha) X & \left(I_{\mathbb{R}^{3}}+(\operatorname{ch}(\alpha)-1) X^{t} X\right)
\end{array}\right]\left[\begin{array}{l}
1 \\
0 \\
0 \\
0
\end{array}\right] t^{\prime}=\left[\begin{array}{c}
1 \\
\beta_{1} \\
\beta_{2} \\
\beta_{3}
\end{array}\right] t
$$

This implies $t\left[\begin{array}{c}1 \\ \beta_{1} \\ \beta_{2} \\ \beta_{3}\end{array}\right]=t^{\prime}\left[\begin{array}{c}\operatorname{ch}(\alpha) \\ \operatorname{sh}(\alpha) X_{1} \\ \operatorname{sh}(\alpha) X_{2} \\ \operatorname{sh}(\alpha) X_{3}\end{array}\right]$ therefore $t=\operatorname{ch}(\alpha) t^{\prime}$ and
$\operatorname{ch}(\alpha)\left[\begin{array}{c}1 \\ \beta_{1} \\ \beta_{2} \\ \beta_{3}\end{array}\right]=\left[\begin{array}{c}\operatorname{ch}(\alpha) \\ \operatorname{sh}(\alpha) X_{1} \\ \operatorname{sh}(\alpha) X_{2} \\ \operatorname{sh}(\alpha) X_{3}\end{array}\right]$ for $t^{\prime} \neq 0 \Rightarrow \operatorname{ch}(\alpha) \vec{\beta}=\operatorname{sh}(\alpha) \vec{X}$
therefore $\vec{\beta}=\operatorname{th}(\alpha) \vec{X} \Rightarrow \vec{\beta}^{2}=\operatorname{th}^{2}(\alpha)$ since $\vec{X}^{2}=1$.
We put $\beta=\sqrt{\vec{\beta}^{2}}$ and $\gamma=\frac{1}{\sqrt{1-\vec{\beta}^{2}}}$.
As $1-t h^{2}(\alpha)=\frac{1}{\operatorname{ch}^{2}(\alpha)} \Rightarrow \operatorname{ch}^{2}(\alpha)=\frac{1}{1-t h^{2}(\alpha)}=\frac{1}{1-\vec{\beta}^{2}}=\gamma^{2}$,
As ch $(\alpha) \geq 1$ we have $\gamma=\operatorname{ch}(\alpha)$;
As $\operatorname{sh}^{2}(\alpha)=\operatorname{ch}^{2}(\alpha)-1=\gamma^{2}-1=\frac{1}{1-\vec{\beta}^{2}}-1=\frac{\beta^{2}}{1-\beta^{2}}=\gamma^{2} \beta^{2}$.
Let's sum up $\gamma=\operatorname{ch}(\alpha), \gamma^{2} \beta^{2}=\operatorname{sh}^{2}(\alpha), \beta^{2}=\boldsymbol{t h}^{2}(\alpha)$.
On the other hand:
$\gamma^{2} \beta^{2}=\gamma^{2}-1=(\gamma+1)(\gamma-1) \Rightarrow \frac{\gamma^{2} \beta^{2}}{(1+\gamma)}=(\gamma-1)=\operatorname{ch}(\alpha)-1$
and $\boldsymbol{X}_{\boldsymbol{t}} \boldsymbol{X}_{j}=\frac{\left(\beta_{i} \beta_{j}\right)}{\boldsymbol{t h}^{2}(\alpha)}=\frac{\left(\beta_{i} \beta_{j}\right)}{\beta^{2}}$ therefore:
$(\operatorname{ch}(\alpha)-1) X_{i} X_{j}=\frac{\gamma^{2} \beta^{2}}{(1+\gamma)} \frac{\left(\beta_{i} \beta_{j}\right)}{\beta^{2}}=\frac{\gamma^{2}}{(1+\gamma)} \beta_{i} \beta_{j}$, that implies:
$\operatorname{Id}_{\mathbb{R}^{3}}+(\operatorname{ch}(\alpha)-1) X^{t} X=\left[\begin{array}{ccc}1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{1}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{3} \\ \frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{2}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{3} \\ \frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{3}^{2}\end{array}\right]$
$=I d_{\mathbb{R}^{3}}+\frac{\gamma^{2} \overrightarrow{\boldsymbol{\beta}} \stackrel{\rightarrow}{\boldsymbol{\beta}}}{(1+\gamma)}=C$

As $\operatorname{sh}(\alpha) X_{i}=\frac{\operatorname{sh}(\alpha) \beta_{i}}{\operatorname{th}(\alpha)}=\operatorname{ch}(\alpha) \beta_{i}=\gamma \beta_{i}$ finally we have
$\exp (\alpha N)=\left[\begin{array}{cc}\gamma & { }^{t}(\overrightarrow{\gamma \beta}) \\ \overrightarrow{\gamma \beta} & C\end{array}\right]$.
Then $\boldsymbol{M}=\left[\begin{array}{cc}\gamma & { }^{t}(\overrightarrow{\gamma \beta}) \\ \overrightarrow{\gamma \beta} & C\end{array}\right] \cdot\left[\begin{array}{cc}1 & 0 \\ 0 & \Omega\end{array}\right]=\left[\begin{array}{cc}\gamma{ }^{t}(\overrightarrow{\gamma \beta}) \Omega \\ \overrightarrow{\gamma \beta} & C \Omega\end{array}\right]$.
Corollary : As $\boldsymbol{M}^{-1}=\boldsymbol{G}^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G}=\left[\begin{array}{cccc}\boldsymbol{m}_{1,1} & -\boldsymbol{m}_{2,1} & -\boldsymbol{m}_{3,1} & -\boldsymbol{m}_{4,1} \\ -\boldsymbol{m}_{1,2} & \boldsymbol{m}_{2,2} & \boldsymbol{m}_{3,2} & \boldsymbol{m}_{4,2} \\ -\boldsymbol{m}_{1,3} & \boldsymbol{m}_{2,3} & \boldsymbol{m}_{3,3} & \boldsymbol{m}_{4,3} \\ -\boldsymbol{m}_{1,4} & \boldsymbol{m}_{2,4} & \boldsymbol{m}_{3,4} & \boldsymbol{m}_{4,4}\end{array}\right]$ if $\boldsymbol{M}=\left(\boldsymbol{m}_{i, j}\right)$,
$\boldsymbol{M}^{-1}=\left[\begin{array}{cc}\gamma & -{ }^{t}(\overrightarrow{\gamma \beta}) \\ -\gamma^{t} \boldsymbol{\Omega \beta} & { }^{t} \Omega C\end{array}\right], \boldsymbol{M}^{-1}$ is of Lorentz $\Rightarrow \boldsymbol{M}^{-1}=\left[\begin{array}{cc}\gamma & -{ }^{t}(\overrightarrow{\gamma \beta}) \boldsymbol{\Omega}^{\prime} \\ -\gamma \boldsymbol{\beta} & \boldsymbol{C} \boldsymbol{\Omega}^{\prime}\end{array}\right]$
then $\stackrel{t}{\Omega} \vec{\beta}=\overrightarrow{\boldsymbol{\beta}} \Rightarrow \stackrel{\leftrightarrow}{\boldsymbol{\beta}} \Omega=\stackrel{\leftrightarrow}{\boldsymbol{\beta}}$ and $M=\left[\begin{array}{cc}\gamma & (\vec{\gamma}) \\ \overrightarrow{\gamma \beta} & C \Omega\end{array}\right]$.
Note: If $\boldsymbol{C} \boldsymbol{\Omega}=\left[\boldsymbol{u}_{1}, \boldsymbol{u}_{2}, \boldsymbol{u}_{3}\right]$ then $\boldsymbol{u}^{2}{ }_{1}+\boldsymbol{u}_{2}^{2}+u^{2}=3+\gamma^{2} \boldsymbol{\beta}^{2}$,
since $\left\|e_{i}\right\|^{2}=\left\|e_{i}\right\|^{2}=-1$ for $i=1,2,3$ and $\gamma^{2} \beta_{i}^{2}-u_{i}^{2}=\left\|e_{i}\right\|^{2}$.

## Lemma 3:

If we consider ${ }^{\boldsymbol{t}} \boldsymbol{e}_{1}{ }^{\prime}=(0,1,0,0),{ }^{\boldsymbol{t}} \boldsymbol{e}_{1}{ }^{\prime}=(0,0,1,0),{ }^{\boldsymbol{t}} \boldsymbol{e}_{1}{ }^{\prime}=(0,0,0,1)$, $f_{1}=M e_{1}{ }^{\prime}, f_{2}=M e_{2}{ }^{\prime}, f_{3}=M e_{3}{ }^{\prime}$ and
$\boldsymbol{P}$ the application $\boldsymbol{P}:{ }^{\boldsymbol{t}}(\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}, \boldsymbol{d}) \rightarrow^{\boldsymbol{t}}(\boldsymbol{b}, \underset{\rightarrow}{\boldsymbol{c}, \boldsymbol{d})}$
then $\Omega=C^{-1}\left[\boldsymbol{P}\left(f_{1}\right), P\left(f_{2}\right), P\left(f_{3}\right)\right]$ and $\overrightarrow{\boldsymbol{\beta}}$ is an eigenvectorfor $C: C \overrightarrow{\boldsymbol{\beta}}=\gamma \overrightarrow{\boldsymbol{\beta}}$.

We have M. $\left[\begin{array}{ccc}0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1\end{array}\right]=\left[\begin{array}{c}t \\ (\overrightarrow{\gamma \beta}) \boldsymbol{\Omega} \\ C \Omega\end{array}\right]=\left[\begin{array}{lll}f_{1} & f_{2} & f_{3}\end{array}\right]$ and $C \boldsymbol{\Omega}=\left[P\left(f_{1}\right), P\left(f_{2}\right), P\left(f_{3}\right)\right]$.
As Maplesoft gives
$\operatorname{det}(C \Omega)=\operatorname{det}(C)=\frac{\gamma^{2} \beta_{1}^{2}+\gamma^{2} \beta_{2}^{2}+\gamma^{2} \beta_{3}^{2}+\gamma+1}{1+\gamma}=1+\frac{\gamma^{2} \vec{\beta} \cdot \vec{\beta}}{1+\gamma}=1+\frac{\gamma^{2}-1}{1+\gamma}=\gamma \geq 1$.
we have $\boldsymbol{\Omega}=\boldsymbol{C}^{-1}\left[\boldsymbol{P}\left(f_{1}\right), \boldsymbol{P}\left(f_{2}\right), \boldsymbol{P}\left(f_{3}\right)\right]$
Maplesoft gives
$C^{-1}=\left[\begin{array}{ccc}\frac{\gamma^{2} \beta_{2}^{2}+\gamma^{2} \beta_{3}^{2}+\gamma+1}{\gamma \cdot(\gamma+1)} & -\frac{\gamma^{2} \beta_{1} \beta_{2}}{\gamma \cdot(\gamma+1)} & -\frac{\gamma^{2} \beta_{1} \beta_{3}}{\gamma \cdot(\gamma+1)} \\ -\frac{\gamma^{2} \beta_{1} \beta_{2}}{\gamma \cdot(\gamma+1)} & \frac{\gamma^{2} \beta_{1}^{2}+\gamma^{2} \beta_{3}^{2}+\gamma+1}{\gamma \cdot(\gamma+1)} & -\frac{\gamma^{2} \beta_{2} \beta_{3}}{\gamma \cdot(\gamma+1)} \\ -\frac{\gamma^{2} \beta_{1} \beta_{3}}{\gamma \cdot(\gamma+1)} & -\frac{\gamma^{2} \beta_{2} \beta_{3}}{\gamma \cdot(\gamma+1)} & \frac{\gamma^{2} \beta_{1}^{2}+\gamma^{2} \beta_{2}^{2}+\gamma+1}{\gamma \cdot(\gamma+1)}\end{array}\right]=$
$=\left[\begin{array}{ccc}\frac{\gamma-\gamma \beta_{1}^{2}+1}{1+\gamma} & -\frac{\gamma \beta_{1} \beta_{2}}{1+\gamma} & -\frac{\gamma \beta_{1} \beta_{3}}{1+\gamma} \\ -\frac{\gamma \beta_{1} \beta_{2}}{1+\gamma} & \frac{\gamma-\gamma \beta_{2}^{2}+1}{1+\gamma} & -\frac{\gamma \beta_{2} \beta_{3}}{1+\gamma} \\ -\frac{\gamma \beta_{1} \beta_{3}}{1+\gamma} & -\frac{\gamma \beta_{2} \beta_{3}}{1+\gamma} & \frac{\gamma-\gamma \beta_{3}^{2}+1}{1+\gamma}\end{array}\right]=I_{\mathbb{R}^{3}}-\frac{\gamma \vec{\beta} \stackrel{\leftrightarrow}{\beta}}{(1+\gamma)}$
because $\gamma^{2} \beta_{2}^{2}+\gamma^{2} \beta_{3}^{2}+\gamma+1=\gamma^{2} \beta^{2}-\gamma^{2} \beta_{1}^{2}+\gamma+1=\gamma^{2}-1-\gamma^{2} \beta_{1}^{2}+\gamma+1$
$=\gamma\left(1+\gamma-\gamma \beta_{1}^{2}\right)$.
As $\boldsymbol{M}=\left[\begin{array}{cc} & { }^{\boldsymbol{t}}(\vec{\gamma}) \boldsymbol{\Omega} \\ \underset{\gamma \boldsymbol{\beta}}{ } & \boldsymbol{C} \boldsymbol{\Omega}\end{array}\right]$ is a matrix of Lorentz :
$\left[\begin{array}{cc}\gamma & \stackrel{\leftrightarrow}{\boldsymbol{\beta}} \\ \gamma^{t} \Omega \cdot \vec{\beta} & { }^{t} \Omega \cdot C\end{array}\right] \cdot\left[\begin{array}{cc}1 & 0 \\ 0 & -1_{R B}\end{array}\right] \cdot\left[\begin{array}{cc}\gamma & \stackrel{\leftrightarrow}{\beta} \Omega \\ \gamma \vec{\beta} & C \Omega\end{array}\right]=\left[\begin{array}{cc}1 & 0 \\ 0 & -1_{R B}\end{array}\right]$ then:
$\left[\begin{array}{cc}-\beta \gamma^{2} \stackrel{\leftrightarrow}{\beta}+\gamma^{2} & -C \Omega \gamma \stackrel{\leftrightarrow}{\beta}+\Omega \gamma^{2} \stackrel{t}{\beta} \\ { }_{-}^{t} \Omega C \gamma \vec{\beta}+{ }^{t} \Omega \gamma^{2} \vec{\beta} & { }^{t} \Omega \gamma^{2} \stackrel{\leftrightarrow}{\beta} \stackrel{\leftrightarrow}{\beta} \Omega-{ }^{t} \Omega C^{2} \Omega\end{array}\right]=\left[\begin{array}{cc}1 & 0 \\ 0 & -1_{R^{3}}\end{array}\right]$ and
$\gamma^{2}\left(1-\vec{\beta}^{2}\right)=1$;
${ }^{t} \Omega \gamma^{2} \vec{\beta} \stackrel{\rightarrow}{\boldsymbol{\beta}} \Omega-^{t} \Omega C^{2} \Omega=-1_{\mathbb{R}^{3}} \Rightarrow^{t} \Omega\left(\gamma^{2} \vec{\beta} \stackrel{t}{\boldsymbol{\beta}}{ }^{t}-C^{2}\right)_{\Omega=-1} 1_{\mathbb{R}^{3}} \Rightarrow C^{2}=1_{\mathbb{R}^{3}}+\gamma^{2} \vec{\beta} \stackrel{\rightarrow}{\boldsymbol{\beta}}$ since ${ }^{t} \Omega \Omega$
$=1_{\vec{R}}$;
${ }^{t} \Omega C \gamma \vec{\beta}={ }^{t} \Omega \gamma^{2} \vec{\beta} \Rightarrow C \vec{\beta}=\gamma \vec{\beta}$.
Note:
For the rest, we recall that the change of basis matrix $\boldsymbol{M}$ has its columns equal to the expression of the basis vectors of the new base expressed in the old basis.

## Corollary :

(0)If $\boldsymbol{M}$ is of Lorentz we have $\boldsymbol{M}$ symmetric $\Leftrightarrow \boldsymbol{\Omega}=\boldsymbol{I} \boldsymbol{d}_{\mathbb{R}^{3}}$.

With the uniqueness of the decomposition we have

$$
M=\left[\begin{array}{cc}
\gamma & (\overrightarrow{\gamma \beta}) \\
\overrightarrow{\gamma \beta} & C
\end{array}\right] \cdot\left[\begin{array}{cc}
1 & 0 \\
0 & \Omega
\end{array}\right]=M_{I} \cdot I d_{\mathbb{R}^{4}}
$$

(1) If $\boldsymbol{M}=\boldsymbol{M}^{\prime} \cdot \boldsymbol{M}^{\prime \prime}$ is a product of two matrices de Lorentz with
$M=\left[\begin{array}{cc}\gamma & (\overrightarrow{\gamma \beta}) \Omega \\ \overrightarrow{\gamma \beta} & C \Omega\end{array}\right], M^{\prime}=\left[\begin{array}{cc}\gamma^{\prime} & \left(\overrightarrow{\gamma^{\prime} \beta^{\prime}}\right) \\ \overrightarrow{\gamma^{\prime} \boldsymbol{\beta}^{\prime}} & C^{\prime}\end{array}\right], M^{\prime \prime}=\left[\begin{array}{ll}\gamma^{\prime \prime} & \left(\begin{array}{l} \\ \gamma^{\prime \prime} \beta^{\prime \prime}\end{array}\right) \\ \overrightarrow{\gamma^{\prime \prime} \beta^{\prime \prime}} & C^{\prime \prime}\end{array}\right]$
then $\quad M=\left[\begin{array}{cc}\gamma^{\prime} \gamma^{\prime \prime}\left(\underset{\beta^{\prime}}{\prime} \vec{\beta}^{\prime \prime}+1\right) & \gamma^{\prime} \gamma^{\prime \prime} \overleftrightarrow{\beta^{\prime \prime}}+\gamma^{\prime} \overleftrightarrow{\beta^{\prime}} C^{\prime \prime} \\ \gamma^{\prime} \gamma^{\prime \prime} \overrightarrow{\beta^{\prime}}+\gamma^{\prime \prime} C^{\prime} \overrightarrow{\beta^{\prime \prime}} & \gamma^{\prime} \gamma^{\prime \prime} \overrightarrow{\beta^{\prime}} \stackrel{\leftrightarrow}{\beta^{\prime \prime}}+C^{\prime} C^{\prime \prime}\end{array}\right] \Rightarrow \gamma=\gamma^{\prime} \gamma^{\prime \prime}\left(\stackrel{\leftrightarrow}{\beta^{\prime}}, \overrightarrow{\beta^{\prime \prime}}+1\right)$,

(2)

If we have $\Omega=\boldsymbol{I d}_{\mathbb{R}^{3}}$ and $\boldsymbol{P}\left(\boldsymbol{f}_{1}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{1}\right), \boldsymbol{P}\left(\boldsymbol{f}_{2}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{2}\right), \boldsymbol{P}\left(\boldsymbol{f}_{3}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{3}\right)$ then $\beta_{i} \beta_{j}=\mathbf{0}$ for $\boldsymbol{i} \neq \boldsymbol{j}$ $\Leftrightarrow \overrightarrow{\boldsymbol{\beta}}$ is parallel to an $\boldsymbol{e}_{\boldsymbol{i}} \boldsymbol{i}=1,2,3$.
$\Omega=I \boldsymbol{R}_{\mathbb{R}^{3}} \Rightarrow C=\left[P\left(f_{1}\right), P\left(f_{2}\right), P\left(f_{3}\right)\right]=\left[\begin{array}{lll}\lambda & 0 & 0 \\ 0 & \mu & 0 \\ 0 & 0 & v\end{array}\right]$
since $P\left(f_{1}\right) / / P\left(e_{1}\right), P\left(f_{2}\right) / / P\left(e_{2}\right), P\left(f_{3}\right) / / P\left(e_{3}\right)$,
$\Rightarrow C$ is diagonal $\Leftrightarrow \beta_{i} \beta_{j}=0$ for $\boldsymbol{i} \neq \boldsymbol{j} \Leftrightarrow \vec{\beta}$ is parallelto an $\boldsymbol{e}_{i} \boldsymbol{i}=1,2,3$.
(3)If we have $\boldsymbol{P}\left(\boldsymbol{f}_{1}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{1}\right), \boldsymbol{P}\left(\boldsymbol{f}_{2}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{2}\right), \boldsymbol{P}\left(\boldsymbol{f}_{3}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{3}\right)$ and
$\vec{\beta}$ is parallel to an $e_{i} i=1,2,3$ then $\Omega=\left[\begin{array}{ccc} \pm 1 & 0 & 0 \\ 0 & \pm 1 & 0 \\ 0 & 0 & \pm 1\end{array}\right]$ :
$\overrightarrow{\boldsymbol{\beta}}$ is parallel to an $\boldsymbol{e}_{\boldsymbol{i}} \Rightarrow \boldsymbol{C}$ is a diagonal matrix ,
$\boldsymbol{P}\left(f_{1}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{1}\right), \boldsymbol{P}\left(\boldsymbol{f}_{2}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{2}\right), \boldsymbol{P}\left(\boldsymbol{f}_{3}\right) / / \boldsymbol{P}\left(\boldsymbol{e}_{3}\right) \Rightarrow \boldsymbol{C} \boldsymbol{\Omega}$ is also a diagonal matrix
$\Rightarrow \Omega$ is diagonal $\Rightarrow \Omega=\left[\begin{array}{ccc} \pm 1 & 0 & 0 \\ 0 & \pm 1 & 0 \\ 0 & 0 & \pm 1\end{array}\right]$ since $\boldsymbol{\Omega}$ is orthogonal .
(4) Let $\boldsymbol{M}$ be a matrix of Lorentz such $\boldsymbol{\varepsilon}=1$ and $\boldsymbol{P}\left(\boldsymbol{f}_{\boldsymbol{i}}\right)=\lambda_{i} \boldsymbol{P}\left(\boldsymbol{e}_{i}\right)$ with $\lambda_{i}>\mathbf{0}$ for $\boldsymbol{i}=1,2,3$, then $\Omega=\boldsymbol{I d}_{\boldsymbol{R}^{3}}$.
Let us consider $\boldsymbol{Q}=\left[\begin{array}{ll}1 & 0 \\ \mathbf{0} & \boldsymbol{\omega}\end{array}\right]$ with $\omega$ a rotation de $\mathbb{R}^{3} \operatorname{suchas} \boldsymbol{P Q}\left(\boldsymbol{e}_{\boldsymbol{1}}\right)=\overrightarrow{\boldsymbol{\beta}}, \boldsymbol{\mu}>\boldsymbol{0}$.
Since $\boldsymbol{P}\left(\boldsymbol{f}_{\boldsymbol{i}}\right)=\lambda_{i} \boldsymbol{P}\left(\boldsymbol{e}_{\boldsymbol{i}}\right)$ with $\lambda_{\boldsymbol{i}}>\mathbf{0}$ for $\boldsymbol{i}=1,2,3$ and $\overrightarrow{\boldsymbol{\beta}}$ common to both basis $\mathscr{B}$ and $\mathscr{B}^{\prime}$ $P Q\left(e^{\prime}{ }_{1}\right)=\mu^{\prime} \vec{\beta}, \mu^{\prime}>0$.
We can consider now :

$$
\begin{array}{cc}
\mathscr{B} \xrightarrow{\boldsymbol{M}} \begin{array}{c}
\mathscr{B}^{\prime} \\
\boldsymbol{Q} \downarrow \\
\mathscr{B}_{1} \xrightarrow{\boldsymbol{M}^{\prime}} \underset{\downarrow}{ } \mathscr{B}^{\prime}
\end{array} \quad \text { with } \boldsymbol{M}^{\prime} \text { a change of basis matrix of Lorentz. }
\end{array}
$$

If we write $\boldsymbol{M}=\Lambda \tilde{\Omega}$ with $\tilde{\Omega}=\left[\begin{array}{ll}1 & 0 \\ 0 & \Omega\end{array}\right]$ and $\Lambda=\left[\begin{array}{cc}\gamma & { }^{t}(\overrightarrow{\gamma \beta}) \\ \underset{\gamma \beta}{\gamma} & C\end{array}\right]$ :

$$
M^{\prime}=^{t} Q M Q={ }^{t} Q \Lambda \tilde{\Omega} Q=\left({ }^{t} Q \Lambda Q\right)\left({ }^{t} \tilde{Q} \tilde{\Omega} Q\right)
$$

since $\boldsymbol{M}^{\prime}$ and $\left({ }^{\boldsymbol{t}} \mathbf{Q} \mathbf{Q} \mathbf{Q}\right)$ are symmetric and ${ }^{\boldsymbol{t}} \mathbf{Q} \boldsymbol{\Omega Q}$ orthogonal then $\boldsymbol{\Omega}=\boldsymbol{I} \boldsymbol{d}_{\mathbb{R}^{3}}$ by uniqueness .

## Corollary:

Let $\boldsymbol{M}$ be a change of basis matrix of Lorentz such $\boldsymbol{\varepsilon}=1$ associated to $\mathbf{2}$ observers $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$ :
$\mathscr{B}=\left(e_{i}\right)_{i=0,3} \xrightarrow{\boldsymbol{M}} \mathscr{B}^{\prime}=\left(\boldsymbol{e}^{\prime} \boldsymbol{i}^{\prime}\right)_{i=0,3} \cdot$ Let's consider another basis $\mathscr{B}_{1}=\left(\boldsymbol{f}^{\prime}\right)_{i=0,3}$ associated to $\boldsymbol{O}^{\prime}$ :
$\mathscr{B}^{\prime}$ and $\mathscr{B}_{1}$ being associated to the same observer, the change of basis matrix is an orthogonal matrix $\boldsymbol{Q}=\left[\begin{array}{ll}1 & 0 \\ 0 & \omega\end{array}\right]$ with $^{\boldsymbol{t}} \boldsymbol{\omega} \boldsymbol{\omega}=\boldsymbol{I d}_{\mathbb{R} 3}, \mathscr{B}_{1}$ chosen as $\boldsymbol{P}\left(\boldsymbol{f}_{\boldsymbol{i}}{ }^{\prime}\right)=\lambda_{i} \boldsymbol{P}\left(\boldsymbol{e}_{\boldsymbol{i}}\right)$ with $\lambda_{\boldsymbol{i}}>\mathbf{0}$ for $\boldsymbol{i}=\mathbf{1}, \mathbf{2}, \mathbf{3}$ and $\boldsymbol{P}$ the application $\boldsymbol{P}:^{\boldsymbol{t}}(\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}, \boldsymbol{d}) \rightarrow^{\boldsymbol{t}}(\boldsymbol{b}, \boldsymbol{c}, \boldsymbol{d})$ : Let's $\boldsymbol{M}^{\prime}$ the matrix of Lorentz from $\mathscr{B}$ to $\mathscr{B}_{1}$ :

then $\boldsymbol{M} \boldsymbol{X}^{\prime}=\boldsymbol{M}^{\prime} \mathbf{Q} \boldsymbol{X}^{\prime}$ with $\boldsymbol{M}^{\prime}=\left[\begin{array}{cc}\gamma & { }^{\boldsymbol{t}}(\overrightarrow{\gamma \beta}) \\ \overrightarrow{\gamma \beta} & \boldsymbol{C}\end{array}\right]$ and $\boldsymbol{Q}=\left[\begin{array}{ll}\mathbf{1} & 0 \\ 0 & \omega\end{array}\right]$ with $^{t} \omega \omega=\boldsymbol{I} \boldsymbol{d}_{\mathbb{R} 3}$.

A special case :
Lemma 4:
Let's assume that $\overrightarrow{\boldsymbol{\beta}}={ }^{\boldsymbol{t}}\left(\boldsymbol{\beta}_{\mathbf{1}}, \mathbf{0}, \boldsymbol{0}\right)$ with $\boldsymbol{\beta}_{\mathbf{1}} \geq \mathbf{0}$ - We put $\boldsymbol{\delta}_{\boldsymbol{i}, \boldsymbol{j}}=\mathbf{1}$ if $\boldsymbol{i}=\boldsymbol{j}$ else $\boldsymbol{\delta}_{\boldsymbol{i}, \boldsymbol{j}}=\mathbf{0}$.
Let's consider $\boldsymbol{e}_{\boldsymbol{i}}=\left(\boldsymbol{\delta}_{i, j}\right), \boldsymbol{j}=\mathbf{0}, \ldots, 3$ and $\boldsymbol{M} \boldsymbol{e}_{\boldsymbol{i}}$ for $\boldsymbol{i}=\mathbf{0}, \ldots, \mathbf{3}$.
Let's put ${ }^{t}\left(\boldsymbol{X}_{0}, \boldsymbol{X}_{1}, \boldsymbol{X}_{2}, \boldsymbol{X}_{3}\right){ }^{1}={ }^{\boldsymbol{t}}\left(\boldsymbol{X}_{1}, \boldsymbol{X}_{2}, \boldsymbol{X}_{3}\right)$.
We assume that $\left[\mathbf{M e}_{\boldsymbol{i}}\right]=\lambda_{i}\left[\boldsymbol{e}_{\boldsymbol{i}}\right]$ with $\lambda_{i}>\mathbf{0}$ for $\boldsymbol{i}=1, \ldots, 3$ (1), we have:

$$
M=\left[\begin{array}{cccc}
\gamma & \gamma \beta_{1} & 0 & 0 \\
\gamma \beta_{1} & \gamma & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]
$$

Proof:
As $1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{1}^{2}=\frac{\left.(1+\gamma)+\gamma^{2} \vec{\beta}^{2}\right)}{(1+\gamma)}=\frac{1+\gamma+\gamma^{2}-1}{(1+\gamma)}=\gamma$,
since $\gamma^{2}-1=\frac{1}{1-\vec{\beta}^{2}}-1=\frac{\vec{\beta}^{2}}{1-\vec{\beta}^{2}}=\gamma^{2} \vec{\beta}^{2}$ we can write :
$M=\exp (\alpha N) \cdot\left[\begin{array}{cc}\varepsilon & 0 \\ 0 & \Omega\end{array}\right]=\left[\begin{array}{cccc}\gamma & \beta_{1} & 0 & 0 \\ \beta_{1} & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1\end{array}\right]\left[\begin{array}{cccc}\varepsilon & 0 & 0 & 0 \\ 0 & \omega_{2,2} & \omega_{2,3} & \omega_{2,4} \\ 0 & \omega_{3,2} & \omega_{3,3} & \omega_{3,4} \\ 0 & \omega_{4,2} & \omega_{4,3} & \omega_{4,4}\end{array}\right]$
$M e_{1}=\left[\begin{array}{c}\gamma \beta_{1} \omega_{2,2} \\ \gamma \omega_{2,2} \\ \omega_{3,2} \\ \omega_{4,2}\end{array}\right], M e_{2}=\left[\begin{array}{c}\gamma \beta_{1} \omega_{2,3} \\ \gamma \omega_{2,3} \\ \omega_{3,3} \\ \omega_{4,3}\end{array}\right]$ and $M e_{3}=\left[\begin{array}{c}\gamma \beta_{1} \omega_{2,4} \\ \gamma \omega_{2,4} \\ \omega_{3,4} \\ \omega_{4,4}\end{array}\right]$
then, by $(1):\left[\begin{array}{cc}\varepsilon & 0 \\ 0 & \Omega\end{array}\right]=\left[\begin{array}{cccc}\varepsilon & 0 & 0 & 0 \\ 0 & \omega_{2,2} & 0 & 0 \\ 0 & 0 & \omega_{3,3} & 0 \\ 0 & 0 & 0 & \omega_{4,4}\end{array}\right]$.
$A s{ }^{t} \Omega \Omega=\underset{\mathbb{R}^{3}}{ }, M=\left[\begin{array}{cccc}\gamma & \gamma \beta_{1} & 0 & 0 \\ \gamma \beta_{1} & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1\end{array}\right]\left[\begin{array}{cccc}\varepsilon & 0 & 0 & 0 \\ 0 & \varepsilon_{1} & 0 & 0 \\ 0 & 0 & \varepsilon_{2} & 0 \\ 0 & 0 & 0 & \varepsilon_{3}\end{array}\right]$ with $\varepsilon_{i}= \pm 1$.
As $\lambda_{i}>0$ and $\gamma>0$ then $\varepsilon_{i}=1$.
We can check ${ }^{\boldsymbol{t}} \boldsymbol{M G M}=\boldsymbol{G}$ and $\left.\left[\boldsymbol{M e}_{\boldsymbol{i}}\right]=\boldsymbol{\lambda}_{\boldsymbol{i}} \mid \boldsymbol{e}_{\boldsymbol{i}}\right]$ with $\boldsymbol{\lambda}_{\boldsymbol{i}}>\mathbf{0}$ for $\boldsymbol{i}=1, \ldots, 3$.
In the case where $\boldsymbol{\varepsilon}=\mathbf{1}$ and $\left[\boldsymbol{M e}_{\boldsymbol{i}} \mid=\boldsymbol{\lambda}_{\boldsymbol{i}}\left[\boldsymbol{e}_{\boldsymbol{i}}\right]\right.$ with $\boldsymbol{\lambda}_{\boldsymbol{i}}>\boldsymbol{0}$ for $\boldsymbol{i}=1, \ldots, 3$,
$\beta_{1} \geq 0$, we have:
$M=\left[\begin{array}{cccc}\gamma & \gamma \beta_{1} & 0 & 0 \\ \gamma \beta_{1} & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1\end{array}\right]$.
Another case :
Lemma 5 :
Let $\boldsymbol{M}$ be a matrix of Lorentz such $\boldsymbol{\varepsilon}=\mathbf{1}$ and $\left[\boldsymbol{M} \boldsymbol{e}_{\boldsymbol{i}}\right]=\boldsymbol{\lambda}_{\boldsymbol{i}}\left[\boldsymbol{e}_{\boldsymbol{i}}\right]$ with $\lambda_{\boldsymbol{i}}>0$ for $\boldsymbol{i}=\mathbf{1 , 2 , 3}$,
for any $\overrightarrow{\boldsymbol{\beta}}$ we have $\Omega=\boldsymbol{I d}_{\mathbb{R}^{3}}$ and $\boldsymbol{M}=\left[\begin{array}{cc}\gamma & { }^{\boldsymbol{t}}(\overrightarrow{\gamma \boldsymbol{\beta}}) \\ \overrightarrow{\gamma \boldsymbol{\beta}} & \boldsymbol{C}\end{array}\right]$ with

$$
C=\left[\begin{array}{ccc}
1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{1}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{1} \beta_{3} \\
\frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{2}^{2} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{2} \beta_{3} \\
\frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \beta_{3} \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \beta_{3}^{2}
\end{array}\right]
$$

Proof:
Let's consider $\boldsymbol{P}=\left[\begin{array}{cc}1 & 0 \\ 0 & \Omega\end{array}\right]$ such $^{t} \Omega \Omega=\boldsymbol{I} \boldsymbol{d}_{\mathbb{R}^{3}}$ and $\boldsymbol{P}\left[\begin{array}{c}0 \\ \vec{\beta}\end{array}\right]=\lambda e_{1}$ with $\lambda>0$
and $\boldsymbol{P}\left[\begin{array}{c}\boldsymbol{0} \\ \overrightarrow{\boldsymbol{\beta}}\end{array}\right]=\lambda^{\prime} \boldsymbol{e} \boldsymbol{\prime}^{\prime}$, since $\overrightarrow{\boldsymbol{\beta}}$ is common to both $\boldsymbol{O}$ and $\boldsymbol{O}^{\prime}$
and $\left[\boldsymbol{M e}_{1}\right]=\boldsymbol{\lambda}_{1}\left[\boldsymbol{e}_{1}\right]$ with $\boldsymbol{\lambda}_{1}>\boldsymbol{0}$.
We can consider now :

$$
\begin{array}{ccc}
\mathscr{B} & \xrightarrow{M} & \mathscr{B}^{\prime} \\
P & & \downarrow P \\
\mathscr{B}_{1} \xrightarrow{M^{\prime}} & \mathscr{B}_{1}^{\prime}
\end{array}
$$

With the basis $\mathscr{B}_{1}=\left(\boldsymbol{P e}_{\mathbf{0}}=\boldsymbol{e}_{\mathbf{0}}, \mathrm{Pe}_{1}, \mathrm{Pe}_{2}, \mathrm{Pe}_{3}\right)$ and $\mathscr{B}^{\prime}{ }_{1}=\left(\boldsymbol{P e}_{\mathbf{0}}{ }_{\mathbf{0}}=\boldsymbol{e}_{\mathbf{\prime}}^{\mathbf{0}}, \boldsymbol{P e}_{\boldsymbol{1}}, \boldsymbol{P e}_{\mathbf{2}}, \boldsymbol{P e}_{\mathbf{3}}\right) \boldsymbol{M}$ is represented by $\boldsymbol{M}^{\mathbf{\prime}}=\boldsymbol{P} \boldsymbol{M}^{\boldsymbol{t}} \boldsymbol{P}$. We have $\boldsymbol{M}^{\prime} \boldsymbol{P} \boldsymbol{e}_{\boldsymbol{i}}=\boldsymbol{P M}{ }^{\boldsymbol{t}} \boldsymbol{P P} \boldsymbol{e}_{i}=\boldsymbol{P M} \boldsymbol{e}_{i}=\lambda_{\boldsymbol{i}} \boldsymbol{P} \boldsymbol{e}_{\boldsymbol{i}}$ for $\boldsymbol{i}=1,2,3$.
${ }^{\boldsymbol{t}} \boldsymbol{P G P}=\left[\begin{array}{cc}1 & 0 \\ 0 & { }^{\boldsymbol{t}} \boldsymbol{\Omega}\end{array}\right]\left[\begin{array}{cc}1 & 0 \\ 0 & -\boldsymbol{I d}_{\mathbb{R}^{3}}\end{array}\right]\left[\begin{array}{cc}1 & 0 \\ 0 & \Omega\end{array}\right]=\boldsymbol{G}$ therefore
$M^{\prime}$ is of Lorentz .
If $W=c t\left[\begin{array}{c}1 \\ \beta_{1} \\ \beta_{2} \\ \beta_{3}\end{array}\right], P W=c t\left[\begin{array}{c}1 \\ \Omega \beta \\ \end{array}\right]=c t\left[\begin{array}{c}1 \\ \beta_{1}^{\prime} \\ \beta_{2}^{\prime} \\ \beta_{3}^{\prime}\end{array}\right]=c t\left[\begin{array}{l}1 \\ \lambda \\ 0 \\ 0\end{array}\right]$ and then
$\overrightarrow{\boldsymbol{\beta}^{\prime}}={ }^{t}\left(\boldsymbol{\beta}_{1}^{\prime}, 0,0\right)$ with $\beta_{1} \geq 0$.
The lemma 4 shows that $\boldsymbol{M}^{\prime}=\left[\begin{array}{cccc}\gamma & \gamma \beta_{1}^{\prime} & 0 & 0 \\ \gamma \beta_{1}^{\prime} & \gamma & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1\end{array}\right]$.
If $\Lambda(\overrightarrow{\boldsymbol{\beta}})=\left[\begin{array}{cc}\gamma & { }^{\boldsymbol{t}}(\vec{\gamma}) \\ \overrightarrow{\gamma \beta} & \\ \boldsymbol{C}\end{array}\right]$ and $\hat{\Omega}=\left[\begin{array}{cc}1 & 0 \\ 0 & \Omega\end{array}\right]$ are the factors
of the polar decomposition of $\boldsymbol{M}$ (lemma $\mathbf{3}$ ),

$\boldsymbol{M}^{\prime}$ is symmetric, ${ }^{\boldsymbol{t}} \boldsymbol{P} \boldsymbol{\Lambda}(\overrightarrow{\boldsymbol{\beta}}) \boldsymbol{P}$ is symmetric and ${ }^{\boldsymbol{t}} \boldsymbol{P} \boldsymbol{\Omega} \boldsymbol{\Omega} \boldsymbol{P}$ is orthogonal since
${ }^{\boldsymbol{t}}\left({ }^{\boldsymbol{t} \boldsymbol{P} \hat{\Omega} \boldsymbol{P})}\left({ }^{\boldsymbol{t} \boldsymbol{P} \boldsymbol{\Omega} \boldsymbol{P}}\right)=\boldsymbol{I d}_{\mathbb{R}^{4}} \cdot\right.$ For short $\boldsymbol{M}^{\boldsymbol{\prime}}=\boldsymbol{M}^{\boldsymbol{\prime}} \cdot \boldsymbol{I} \boldsymbol{d}_{\mathbb{R}^{4}}=\left({ }^{\boldsymbol{t}} \boldsymbol{P} \boldsymbol{\Lambda}(\overrightarrow{\boldsymbol{\beta}}) \boldsymbol{P}\right)\left({ }^{\boldsymbol{t} \boldsymbol{P} \hat{\boldsymbol{\Omega}} \boldsymbol{P}}\right)$.

and then $\hat{\Omega}=\boldsymbol{I d}_{\mathbb{R}^{4}}$.

Eigenvalues and eigenvectors when $\Omega=I d_{\mathbb{R} 3}$.

## Lemma 4 :

With the lemma 1 notations :
$\boldsymbol{N}=\left[\begin{array}{cccc}0 & \boldsymbol{x}_{1} & \boldsymbol{x}_{2} & \boldsymbol{x}_{3} \\ \boldsymbol{x}_{1} & 0 & 0 & 0 \\ \boldsymbol{x}_{2} & 0 & 0 & 0 \\ \boldsymbol{x}_{3} & 0 & 0 & 0\end{array}\right] \operatorname{avec} \overrightarrow{\boldsymbol{X}}=\left[\begin{array}{c}\boldsymbol{x}_{1} \\ \boldsymbol{x}_{2} \\ \boldsymbol{x}_{3}\end{array}\right]$ et $\overrightarrow{\boldsymbol{X}} \cdot \overrightarrow{\boldsymbol{X}}=1$.
As the eigenvalues of $\mathbf{N}$ are $\{1,-1,0,0\}$ and the eigenvectors are :
$\left\{\left[\begin{array}{l}1 \\ x_{1} \\ x_{2} \\ x_{3}\end{array}\right],\left[\begin{array}{c}-1 \\ x_{1} \\ x_{2} \\ x_{3}\end{array}\right],\left[\begin{array}{c}0 \\ -x_{2} \\ x_{1} \\ 0\end{array}\right],\left[\begin{array}{c}0 \\ -x_{3} \\ 0 \\ x_{1}\end{array}\right]\right\}$
If we consider $\boldsymbol{B}$ the basis made of thes eigenvectors and the diagonal matrix made of the eigenvalues of $\boldsymbol{N}: \boldsymbol{N}=\boldsymbol{B} \boldsymbol{D} \boldsymbol{B}^{-1} \cdot$ Don't forget that $\boldsymbol{x}_{1}^{2}+\boldsymbol{x}_{2}^{2}+\boldsymbol{x}_{3}^{2}=\overrightarrow{\boldsymbol{X}} \cdot \overrightarrow{\boldsymbol{X}}=1$.

$$
\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
x_{1} & x_{1} & -x_{2} & -x_{3} \\
x_{2} & x_{2} & x_{1} & 0 \\
x_{3} & x_{3} & 0 & x_{1}
\end{array}\right] \cdot\left[\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{array}\right] \cdot\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
x_{1} & x_{1} & -x_{2} & -x_{3} \\
x_{2} & x_{2} & x_{1} & 0 \\
x_{3} & x_{3} & 0 & x_{1}
\end{array}\right]^{-1}
$$

$$
=\left[\begin{array}{cccc}
0 & \frac{x_{1}}{x_{1}^{2}+x_{2}^{2}+x_{3}^{2}} & \frac{x_{2}}{x_{1}^{2}+x_{2}^{2}+x_{3}^{2}} & \frac{x_{3}}{x_{1}^{2}+x_{2}^{2}+x_{3}^{2}} \\
x_{1} & 0 & 0 & 0 \\
x_{2} & 0 & 0 & 0 \\
x_{3} & 0 & 0 & 0
\end{array}\right]
$$

Let's consider now $\exp (\alpha N)$, as $\exp (\alpha N)=\exp \left(\boldsymbol{B} \alpha D B^{-1}\right)=\boldsymbol{\operatorname { B e x p }}(\alpha \boldsymbol{D}) \boldsymbol{B}^{-1}$ and thus :

$$
\exp (\alpha N)=\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
x_{1} & x_{1} & -x_{2} & -x_{3} \\
x_{2} & x_{2} & x_{1} & 0 \\
x_{3} & x_{3} & 0 & x_{1}
\end{array}\right] \cdot\left[\begin{array}{cccc}
e^{\alpha} & 0 & 0 & 0 \\
0 & e^{-\alpha} & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] \cdot\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
x_{1} & x_{1} & -x_{2} & -x_{3} \\
x_{2} & x_{2} & x_{1} & 0 \\
x_{3} & x_{3} & 0 & x_{1}
\end{array}\right]^{-1}
$$

However $\gamma=\operatorname{ch}(\alpha) \Leftrightarrow \alpha=\ln \left(\gamma+\sqrt{\gamma^{2}-1}\right) \Rightarrow e^{\alpha}=\gamma+\sqrt{\gamma^{2}-1,}$
as $\gamma^{2}-1=\beta^{2} \gamma^{2} \Rightarrow e^{\alpha}=\gamma(1+\beta)=\frac{(1+\beta)}{\sqrt{(1+\beta)(1-\beta)}}=\sqrt{\frac{1+\beta}{1-\beta}}$ and
$e^{-\alpha}=\gamma(1-\beta)=\sqrt{\frac{1-\beta}{1+\beta}}$ with $\beta=\sqrt{\vec{\beta} \cdot \vec{\beta}}$.
We assume that $\beta \neq 0$ if not $\exp (\alpha N)=I d$.
As $\operatorname{coth}(\alpha)=\beta^{-1}$ and $\vec{X}=\operatorname{coth}(\alpha) \vec{\beta}:$
We assume that $\boldsymbol{\beta} \neq 0$

$$
\begin{aligned}
& \exp (\alpha N)=\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
\beta^{-1} \cdot \beta_{1} & \beta^{-1} \cdot \beta_{1} & -\beta^{-1} \cdot \beta_{2} & -\beta^{-1} \cdot \beta_{3} \\
\beta^{-1} \cdot \beta_{2} & \beta^{-1} \cdot \beta_{2} & \beta^{-1} \cdot \beta_{1} & 0 \\
\beta^{-1} \cdot \beta_{3} & \beta^{-1} \cdot \beta_{3} & 0 & \beta^{-1} \cdot \beta_{1}
\end{array}\right] \cdot\left[\begin{array}{cccc}
\gamma \cdot(1+\beta) & 0 & 0 & 0 \\
0 & \gamma \cdot(1-\beta) & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] \\
& \cdot\left[\begin{array}{cccc}
1 & -1 & 0 & 0 \\
\beta^{-1} \cdot \beta_{1} & \beta^{-1} \cdot \beta_{1} & -\beta^{-1} \cdot \beta_{2} & -\beta^{-1} \cdot \beta_{3} \\
\beta^{-1} \cdot \beta_{2} & \beta^{-1} \cdot \beta_{2} & \beta^{-1} \cdot \beta_{1} & 0 \\
\beta^{-1} \cdot \beta_{3} & \beta^{-1} \cdot \beta_{3} & 0 & \beta^{-1} \cdot \beta_{1}
\end{array}\right]^{-1} \\
& =\left[\begin{array}{cccc}
\gamma & \frac{\gamma \beta_{1} \beta^{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\gamma \beta^{2} \beta_{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{2 \beta_{3} \beta^{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} \\
\beta_{1} \gamma & \frac{\gamma \beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\beta_{2} \beta_{1}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\beta_{3} \beta_{1}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} \\
\beta_{2} \gamma & \frac{\beta_{2} \beta_{1}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\gamma \beta_{2}^{2}+\beta_{1}^{2}+\beta_{3}^{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\beta_{2} \beta_{3}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} \\
\beta_{3} \gamma & \frac{\beta_{3} \beta_{1}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\beta_{2} \beta_{3}(\gamma-1)}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}} & \frac{\gamma \beta_{3}^{2}+\beta_{1}^{2}+\beta_{2}^{2}}{\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}}
\end{array}\right]
\end{aligned}
$$

$$
\begin{aligned}
& =\left[\begin{array}{cccc}
\gamma & \gamma \cdot \beta_{1} & \gamma \cdot \beta_{2} & \gamma \cdot \beta_{1} \\
\gamma \cdot \beta_{1} & 1+\frac{\beta_{I}^{2}(\gamma-1)}{\beta^{2}} & \frac{\beta_{2} \beta_{1}(\gamma-1)}{\beta^{2}} & \frac{\beta_{3} \beta_{1}(\gamma-1)}{\beta^{2}} \\
\gamma \cdot \beta_{2} & \frac{\beta_{2} \beta_{I}(\gamma-1)}{\beta^{2}} & 1+\frac{\beta_{2}^{2}(\gamma-1)}{\beta^{2}} & \frac{\beta_{2} \beta_{3}(\gamma-1)}{\beta^{2}} \\
\gamma \cdot \beta_{3} & \frac{\beta_{3} \beta_{I}(\gamma-1)}{\beta^{2}} & \frac{\beta_{2} \beta_{3}(\gamma-1)}{\beta^{2}} & 1+\frac{\beta_{3}^{2}(\gamma-1)}{\beta^{2}}
\end{array}\right] \\
& =\left[\begin{array}{cccc}
\gamma & \gamma \cdot \beta_{1} & \gamma \cdot \beta_{2} & \gamma \cdot \beta_{3} \\
\gamma \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{3} \\
\gamma \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{3} \\
\gamma \cdot \beta_{3} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{3}
\end{array}\right] \\
& \text { because } 1 /\left(\left(1+(\gamma)^{2}\right)\right)=\frac{(\gamma-1)}{\beta^{2}} \text {. }
\end{aligned}
$$

We can verify:
$\left[\begin{array}{cccc}\gamma & \gamma \cdot \beta_{1} & \gamma \cdot \beta_{2} & \gamma \cdot \beta_{3} \\ \gamma \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{3} \\ \gamma \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{3} \\ \gamma \cdot \beta_{3} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{3}\end{array}\right] \cdot\left[\begin{array}{c}1 \\ \beta^{-1} \cdot \beta_{1} \\ \beta^{-1} \cdot \beta_{2} \\ \beta^{-1} \cdot \beta_{3}\end{array}\right]=$

$$
\left.\begin{array}{c}
\frac{\gamma\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right)}{\beta} \\
\frac{\beta_{1}\left(1+\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma\right)}{(1+\gamma) \beta} \\
\frac{\beta_{2}\left(1+\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma\right)}{(1+\gamma) \beta} \\
\frac{\beta_{3}\left(1+\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma\right)}{(1+\gamma) \beta}
\end{array}\right]=\gamma(1+\beta)\left[\begin{array}{c}
1 \\
\beta^{-1} \cdot \beta_{1} \\
\beta^{-1} \cdot \beta_{2} \\
\beta^{-1} \cdot \beta_{3}
\end{array}\right] \text { because }
$$

$$
1+\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma=1+\beta \cdot(1+\beta) \gamma^{2}+(\beta+1) \gamma
$$

$$
=1+(\beta+1) \gamma(1+\gamma) .
$$

$$
\text { thus } \frac{\beta_{1}\left(1+\left(\beta_{1}^{2}+\beta_{2}^{2}+\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma\right)}{(1+\gamma) \beta}=\frac{\beta_{1}(1+(\beta+1) \gamma(1+\gamma))}{(1+\gamma) \beta} \text { however }
$$

$$
\gamma(1+\beta) \beta^{-1} \cdot \beta_{1}=\frac{\beta_{1}\left(1+\left(\beta^{2}+\beta\right) \gamma^{2}+(\beta+1) \gamma\right)}{(1+\gamma) \beta} \Leftrightarrow \gamma(1+\beta) \cdot \beta_{I}(1+\gamma)=\beta_{I}(1+\beta(\gamma
$$

$$
\left.\left.+\gamma^{2}\right)+\gamma^{2}-1+\gamma\right)
$$

because $\gamma^{2} \beta^{2}=\gamma^{2}-1$ et $\beta_{I}\left(\beta\left(\gamma+\gamma^{2}\right)+\gamma^{2}+\gamma\right)=\beta_{I}\left(\gamma+\gamma^{2}\right)(1+\beta)=\beta_{I}(1+\gamma) \gamma(1+\beta)$. In the same way:
$\left[\begin{array}{cccc}\gamma & \gamma \cdot \beta_{1} & \gamma \cdot \beta_{2} & \gamma \cdot \beta_{3} \\ \gamma \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{1} \cdot \beta_{3} \\ \gamma \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{1} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{2} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{2} \cdot \beta_{3} \\ \gamma \cdot \beta_{3} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{1} & \frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{2} & 1+\frac{\gamma^{2}}{(1+\gamma)} \cdot \beta_{3} \cdot \beta_{3}\end{array}\right] \cdot\left[\begin{array}{c}-1 \\ \beta^{-1} \cdot \beta_{1} \\ \beta^{-1} \cdot \beta_{2} \\ \beta^{-1} \cdot \beta_{3}\end{array}\right]=$

$$
\left.\begin{array}{c}
-\frac{\gamma\left(-\beta_{1}^{2}-\beta_{2}^{2}-\beta_{3}^{2}+\beta\right)}{\beta} \\
-\frac{\left(-1+\left(-\beta_{1}^{2}-\beta_{2}^{2}-\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta-1) \gamma\right) \beta_{1}}{(1+\gamma) \beta} \\
-\frac{\left(-1+\left(-\beta_{1}^{2}-\beta_{2}^{2}-\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta-1) \gamma\right) \beta_{2}}{(1+\gamma) \beta} \\
-\frac{\left(-1+\left(-\beta_{1}^{2}-\beta_{2}^{2}-\beta_{3}^{2}+\beta\right) \gamma^{2}+(\beta-1) \gamma\right) \beta_{3}}{(1+\gamma) \beta}
\end{array}\right]=\gamma(1-\beta)\left[\begin{array}{c}
-1 \\
\beta^{-1} \cdot \beta_{1} \\
\beta^{-1} \cdot \beta_{2} \\
\beta^{-1} \cdot \beta_{3}
\end{array}\right] .
$$

We can point out that the 2 first eigenvectors are light vectors .

$$
=\left[\begin{array}{c}
0 \\
-\beta^{-1} \cdot \beta_{3} \\
0 \\
\beta^{-1} \cdot \beta_{1}
\end{array}\right] .
$$

For short the eigenvalues are $\{\gamma(1+\beta), \gamma(1-\beta), 1,1\}$ and
the eingeinvectors $\left\{\left[\begin{array}{c}1 \\ \beta^{-1} \cdot \beta_{1} \\ \beta^{-1} \cdot \beta_{2} \\ \beta^{-1} \cdot \beta_{3}\end{array}\right],\left[\begin{array}{c}-1 \\ \beta^{-1} \cdot \beta_{1} \\ \beta^{-1} \cdot \beta_{2} \\ \beta^{-1} \cdot \beta_{3}\end{array}\right],\left[\begin{array}{c}0 \\ -\beta^{-1} \cdot \beta_{2} \\ \beta^{-1} \cdot \beta_{1} \\ 0\end{array}\right],\left[\begin{array}{c}0 \\ -\beta^{-1} \cdot \beta_{3} \\ 0 \\ \beta^{-1} \cdot \beta_{1}\end{array}\right]\right\}$

Eigenvalues of a product of 2 symmetric matrices:
If $\boldsymbol{A}$ and $\boldsymbol{B}$ are real symmetric matrices such that the eigenvalues of $\boldsymbol{A}$ are strictly positive and those of $\boldsymbol{B}$ positive then the product $\boldsymbol{A B}$ is also $\mathbb{R}$-diagonalizable .
(We remind that if $\boldsymbol{A}$ is symmetric with positive eigenvalue then there exists a single matrice symmetric with eigenvalues positive $\left.A^{\frac{1}{2}} \operatorname{such} a s\left(A^{\frac{1}{2}} \cdot A^{\frac{1}{2}}\right)=A\right)$. Proof:
We can write $\boldsymbol{A} \boldsymbol{B}=\boldsymbol{A}^{\frac{1}{2}}\left(\boldsymbol{A}^{\frac{1}{2}} \boldsymbol{B} \boldsymbol{A}^{\frac{1}{2}}\right)_{\boldsymbol{A}}{ }^{-\frac{1}{2}}$, thus $\boldsymbol{A B}$ and $\boldsymbol{A}^{\frac{1}{2}} \boldsymbol{B} \boldsymbol{A}^{\frac{1}{2}}$ have the same eigenvalues .
However ${ }^{\boldsymbol{t}}\left(\boldsymbol{A}^{\frac{1}{2}} \boldsymbol{B} \boldsymbol{A}^{\frac{1}{2}}\right)=\left(\boldsymbol{A}^{\frac{1}{2}} \boldsymbol{B} \boldsymbol{A}^{\frac{1}{2}}\right)$ thus $\left(\boldsymbol{A}^{\frac{1}{2}} \boldsymbol{B} \boldsymbol{A}^{\frac{1}{2}}\right)$ is symmetric therefore $\mathbb{R}$-diagonalizable.

Note : If $\boldsymbol{\Omega} \neq \boldsymbol{I d}_{\boldsymbol{R} \boldsymbol{3}} \boldsymbol{M}$ may have no real eigenvalues for example $\overrightarrow{\boldsymbol{\beta}}=\overrightarrow{\boldsymbol{0}}$ and $\boldsymbol{\Omega}$ being a rotation .

## (5)Space - time vectors properties:

In a Minkowski space, the quadratic form associated with this space
makes it possible to classify the vectors into 3 categories that we are going to study.

## Vectors in a Minkowski - space

( $J$-M. Souriau."Calcul Linéaire " •PUF 1964 .)
We consider the vector space $\mathbb{R}^{4}$ of $\mathbf{4}$ dimensions with the quadratic form of Lorentz :

$\boldsymbol{G}=\left[\begin{array}{cc}\mathbf{1} & \boldsymbol{t}_{\boldsymbol{0}} \\ \boldsymbol{0} & -\boldsymbol{I d}_{\mathbb{R}^{3}}\end{array}\right]$ where $\mathbf{0}$ is the null column of $\mathbb{R}^{3}$.
We give $\mathbb{R}^{4} a \boldsymbol{\Phi}$-orthonormal basis .
We want to describe the sets of vectors $\mathbb{R}^{4}$ defined according to the sign of $\boldsymbol{\Phi}(\boldsymbol{X})$.
We distinguish 3 subsets :
$\boldsymbol{E}+=\left\{\boldsymbol{X} \in \mathbb{R}^{4} / \boldsymbol{\Phi}(\boldsymbol{X})>\boldsymbol{0}\right\} \cup\{\boldsymbol{0}\}:$ time vectors,
$\boldsymbol{E}_{-}=\left\{\boldsymbol{X} \in \mathbb{R}^{4} / \boldsymbol{\Phi}(\boldsymbol{X})<\boldsymbol{0}\right\} \cup\{\boldsymbol{0}\}:$ space vectors,
$\boldsymbol{E}_{\boldsymbol{0}}=\left\{\boldsymbol{X} \in \mathbb{R}^{4} / \boldsymbol{\Phi}(\boldsymbol{X})=0\right\}$ : isotropic vectors.
Whether or not to add $\{\boldsymbol{0}\}$ to $\boldsymbol{E}_{+}$and to $\boldsymbol{E}_{-}$varies according to different authors.
We notice that the nature of vectors is independent of the chosen basis of $\mathbb{R}^{4} \boldsymbol{\Phi}$-orthonormed. If we note $\boldsymbol{P}$ the matrix of passage from the basis $\mathscr{B}$ to the basis $\mathscr{B}^{\prime}$,
if $\boldsymbol{P}$ is a matrix of Lorentz; ${ }^{\boldsymbol{t}} \boldsymbol{P G P}=\boldsymbol{G}, \boldsymbol{X}=\boldsymbol{P} \boldsymbol{X}{ }^{\prime}, \boldsymbol{Y}=\boldsymbol{P} \boldsymbol{Y}^{\prime}$ then
${ }^{t} \boldsymbol{X} \boldsymbol{G X}=\left({ }^{\boldsymbol{t}} \boldsymbol{X}^{, t} \boldsymbol{P}\right) \boldsymbol{G}\left(\boldsymbol{P} X^{\prime}\right)={ }^{\boldsymbol{t}} \boldsymbol{X}^{\prime}\left({ }^{\boldsymbol{t}} \boldsymbol{P} \boldsymbol{G P}\right) X^{\prime}={ }^{t} X^{\prime} \boldsymbol{G} X^{\prime}$.

## Lemma 1:

We consider the vector space $\mathbb{R}^{4}$ of 4 dimensions with the quadratic form of Lorentz.
In $\mathbb{R}^{4}$ there is a $\mathbf{3}$ - dimensional subspace of space vectors.
Proof:
Consider for example : $\left\{\boldsymbol{X} \in \mathbb{R}^{4} / \boldsymbol{x}_{1}=\boldsymbol{0}\right\}$.

## Lemma 2 :

We consider the vector space $\mathbb{R}^{4}$ with the quadratic form of Lorentz.
There are no time vectors subspace of dimension $>=2$.
Proof:
Because otherwise there exists a subspace $\boldsymbol{F}$ of dimension at least equal to $\mathbf{2}$ of time vectors .
As there exists a subspace $G$ of space vectors of dimension $\mathbf{3}$ and as $\boldsymbol{F} \cap \boldsymbol{G}=\{\boldsymbol{0}\}$ and therefore $\operatorname{dim}\left(\mathbb{R}^{4}\right) \geq 5$.

## Lemma 3:

We consider the vector space with the quadratic form of Lorentz.
Let $\mathbf{2}$ vectors of $\mathbb{R}^{4} \boldsymbol{X}$ and $\boldsymbol{Y} \neq\{\boldsymbol{0}\}$ such that ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G X} \geq \mathbf{0},{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y} \geq 0$ and ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}=\mathbf{0}$
then $\boldsymbol{X}$ and $\boldsymbol{Y}$ are collinear and isotropic.
Proof
We consider $\boldsymbol{X}$ and $\boldsymbol{Y} 2$ non-zero time vectors.
If they are independent they generate a subspace of dimension 2 of positive vectors :

It is impossible therefore : $\exists \lambda \neq 0 \in \mathbb{R}$ such that
$\boldsymbol{X}=\lambda \boldsymbol{Y}$ and then $: \mathbf{0}={ }^{t} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}=\lambda^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}=\frac{\mathbf{1}}{\lambda}{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}$.

## Lemma 4:

(1) Any non - zero vector $\boldsymbol{X}$ orthogonal to a non-zero time vector $\boldsymbol{Y}\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}=\boldsymbol{0}\right)$ is a space vector.
(2) 2 non - zero isotropic independent vectors $\boldsymbol{X}$ and $\boldsymbol{Y}$ are never orthogonal.

Proof:
(1)If $\boldsymbol{X}$ was a non - zero time vector: ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}>\boldsymbol{0}$ and $\boldsymbol{Y}$ such that ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G X}>\boldsymbol{0}$ then ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}<\mathbf{0}$ because otherwise ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G Y} \geq \mathbf{0}$ and as ${ }^{\boldsymbol{t}} \boldsymbol{X G X}>\mathbf{0}$ and ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}=\mathbf{0}$, according to lemma $\mathbf{3} \boldsymbol{X}$ would be isotropic, which is contradictory.
(2) Because otherwise $\mathbf{0}={ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}={ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}={ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}$ according to lemma $\mathbf{5} \boldsymbol{X}$ and $\boldsymbol{Y}$ are linearly dependent.

Definition: For any time vector $\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G X} \geq 0\right)$ we set $\|\boldsymbol{X}\|_{\boldsymbol{G}}=\sqrt{{ }^{t} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}}$.

## Lemma 5 :

Let $\boldsymbol{\varphi}$ be a bilinear symmetrical nondegenerate form on a vector space $\boldsymbol{E}$ of dimension $\boldsymbol{n}$, then for any base $\mathscr{B}\left(\boldsymbol{e}_{\boldsymbol{1}}, \ldots ., \boldsymbol{e}_{\boldsymbol{n}}\right)$, if we consider the matrix representing $\boldsymbol{\varphi}$ in $\mathscr{B}$
$\boldsymbol{Q}=\left(\boldsymbol{\varphi}\left(\boldsymbol{e}_{\boldsymbol{i}}, \boldsymbol{e}_{\boldsymbol{j}}\right)\right)$, then the determinant of $\boldsymbol{Q}$ is of the sign of $(-\boldsymbol{1})^{\boldsymbol{n}-\boldsymbol{p}}$
where $\boldsymbol{p}$ is the positive index of inertia of $\boldsymbol{\varphi}$.

## Proof:

There exists a base $\mathscr{B}^{\prime}\left(\boldsymbol{e}_{\boldsymbol{1}}, \ldots ., \boldsymbol{e}_{\boldsymbol{n}}^{\boldsymbol{\prime}}\right)$ where the matrix representing $\varphi$ is the form:

$$
Q^{\prime}=\left[\begin{array}{cc}
\boldsymbol{I} d_{R p} & 0 \\
0 & -\boldsymbol{I} d_{R q}
\end{array}\right] \text {,then } \operatorname{det}\left(Q^{\prime}\right)=(-1)^{n-p} .
$$

Let $\boldsymbol{S}$ be the matrix of passage from the basis $\mathscr{B}^{\prime}$ to the basis $\mathscr{B}$ we have $\operatorname{det}(Q)=\operatorname{det}\left({ }^{t} S Q ' S\right)=\operatorname{det}\left(Q^{\prime}\right)(\operatorname{det}(S))^{2} \Rightarrow \operatorname{sign}(\operatorname{det}(Q))=(-1)^{\boldsymbol{n}-p}$.

Lemma 6: Cauchy - Schwartz's counter inequality.
We have $\left.\right|^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}\left|\geq\|\boldsymbol{X}\|_{\boldsymbol{G}}\right| \boldsymbol{\boldsymbol { Y }} \|_{\boldsymbol{G}}$ for any time or isotropic vectors.
Proof:
Let us consider the matrix $\boldsymbol{S}$ made up of the $\mathbf{2}$ columns $\boldsymbol{X} \in \mathbb{R}^{4}$ and $\boldsymbol{Y} \in \mathbb{R}^{4}: \boldsymbol{S}=[\boldsymbol{X}, \boldsymbol{Y}]$. We assume that $\boldsymbol{X}$ and $\boldsymbol{Y}$ are non - zero time vectors because if one of them is isotropic or zero the `inequality is obvious.

and $\operatorname{det}\left({ }^{\boldsymbol{t}} \boldsymbol{S G S}\right)=\|\boldsymbol{X}\|_{\boldsymbol{G}}{ }^{2}\|\boldsymbol{Y}\|_{\boldsymbol{G}}{ }^{2}-\left({ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}\right){ }^{2}$.
If $\operatorname{det}\left({ }^{\boldsymbol{t}} \boldsymbol{S G S}\right)=\mathbf{0}$ the lemma is proved.
If $\operatorname{det}\left({ }^{\boldsymbol{t}} \boldsymbol{S G S}\right) \neq \mathbf{0}$ and if $\boldsymbol{X}=\lambda \boldsymbol{Y}, \lambda \in \mathbb{R}^{*}$,
then $\operatorname{det}\left({ }^{\boldsymbol{t}} \boldsymbol{S G S}\right)=\left[\begin{array}{cc}\lambda^{2} \boldsymbol{t} \boldsymbol{Y G Y} & \lambda^{t} \boldsymbol{Y G Y} \\ \lambda^{t} \boldsymbol{Y G Y} & { }^{t} \boldsymbol{Y G Y}\end{array}\right]=\mathbf{0}$
It's impossible therefore $\boldsymbol{X}$ and $\boldsymbol{Y}$ are non coplanar : $\boldsymbol{X}$ and $\boldsymbol{Y}$ form a base $\boldsymbol{S}=[\boldsymbol{X}, \boldsymbol{Y}]$ of a vector subspace $\boldsymbol{F}$ of $\mathbb{R}^{4}$ of dimension 2.

As ${ }^{\boldsymbol{t}} \boldsymbol{S} \boldsymbol{G} \boldsymbol{S}=\left[\begin{array}{ll}{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X} & { }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y} \\ { }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{X} & { }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}\end{array}\right],{ }^{\boldsymbol{t}} \boldsymbol{S} \boldsymbol{G} \boldsymbol{S}$ defines a form, bilinear and symmetrical $\boldsymbol{\Psi}$
on $\boldsymbol{F}$ by $\boldsymbol{\Psi}(\boldsymbol{u}, \boldsymbol{v})={ }^{\boldsymbol{t}} \boldsymbol{U}{ }^{\boldsymbol{t}} \boldsymbol{S} \boldsymbol{G} \boldsymbol{S} \boldsymbol{V}$ with $\boldsymbol{u}=\boldsymbol{S} \boldsymbol{U}$ and $\boldsymbol{v}=\boldsymbol{S} \boldsymbol{V}$.
Let $\boldsymbol{\varphi}$ be thebilinear form defined on $\mathbb{R}^{4}$ whose matrix is $\boldsymbol{G}$.
We immediately check that $\boldsymbol{\varphi}_{/ \boldsymbol{F}}$ is also a bilinear symmetrical form on $\boldsymbol{F}$.
Let us show that $\varphi_{/ F}$ is regular, that is :
$\boldsymbol{F}^{\perp}=\left\{\boldsymbol{u} \in \boldsymbol{F} / \boldsymbol{\varphi}_{/ \boldsymbol{F}}(\boldsymbol{u}, \boldsymbol{v})=\boldsymbol{0}, \forall \boldsymbol{v} \in \boldsymbol{F}\right\}=\{\boldsymbol{0}\}$.
$\boldsymbol{S}$, being a basis of $\boldsymbol{F}$, is a bijective application of $\mathbb{R}^{2}$ on $\boldsymbol{F}$.
If $\boldsymbol{G}$ is the representation of $\boldsymbol{\varphi} \mathbb{R}^{4},{ }^{t} \boldsymbol{S} \boldsymbol{G} \boldsymbol{S}$ is the representation of $\boldsymbol{\varphi}_{/ \boldsymbol{F}}$ in $\boldsymbol{F}$
provided with the base $\boldsymbol{S}$ : let $\boldsymbol{u}$ and $\boldsymbol{v} \mathbf{2}$ vectors of $\boldsymbol{F}$;
we have if $\tilde{\boldsymbol{U}}$ and $\tilde{\boldsymbol{V}}$ the representations of $\boldsymbol{u}$ and $\boldsymbol{v}$ in $\mathbb{R}^{4}$,
$\boldsymbol{U}$ and $\boldsymbol{V}$ in $F$ with the base $\boldsymbol{S}$ and $\widetilde{\boldsymbol{U}}=\boldsymbol{S} \boldsymbol{U}, \widetilde{\boldsymbol{V}}=\boldsymbol{S} \boldsymbol{V}$ :
$\boldsymbol{\varphi}(\boldsymbol{u}, \boldsymbol{v})=\boldsymbol{\varphi}_{/ \boldsymbol{F}}(\boldsymbol{u}, \boldsymbol{v})={ }^{\boldsymbol{t}} \tilde{\boldsymbol{U}} \boldsymbol{G} \tilde{\boldsymbol{V}}={ }^{\boldsymbol{t}} \boldsymbol{U}^{\boldsymbol{t}} \boldsymbol{S} \boldsymbol{G} \boldsymbol{S} \boldsymbol{V}$.
So let $u \boldsymbol{u} \in \boldsymbol{F}^{\perp}$ and $\boldsymbol{v} \in \boldsymbol{F}, \boldsymbol{u}=\boldsymbol{S} \boldsymbol{U}$ and $\boldsymbol{v}=\boldsymbol{S} \boldsymbol{V}$ with $\boldsymbol{U}$ and $\boldsymbol{V}$ element of $\mathbb{R}^{2}$.
We have $\boldsymbol{\varphi}_{/ \boldsymbol{F}}(\boldsymbol{u}, \boldsymbol{v})=^{\boldsymbol{t}} \boldsymbol{V}^{\boldsymbol{t}} \boldsymbol{S G S U}=\mathbf{0} \quad \forall \boldsymbol{V} \in \mathbb{R}^{2}$ and therefore ${ }^{\boldsymbol{t}} \boldsymbol{S} \boldsymbol{G S U}=\mathbf{0}$
as $\operatorname{det}(\boldsymbol{S G S}) \neq \mathbf{0}$ we have $\boldsymbol{U}=\mathbf{0}$.
$\boldsymbol{\varphi}_{/ \boldsymbol{F}}$ is indeed a bilinear symmetric regular form on $\boldsymbol{F}$.
The lemma 5 applies: $\boldsymbol{\operatorname { s i g n }}\left(\boldsymbol{\operatorname { d e t }}\left({ }^{\boldsymbol{t}} \boldsymbol{S G S}\right)\right)=(-\boldsymbol{1})^{\boldsymbol{2}-\boldsymbol{p}}, \boldsymbol{p}$ the inertia index of $\boldsymbol{\varphi}_{/ \boldsymbol{F}}$
but $\boldsymbol{F}$ being of dimension $\mathbf{2}$, according to the lemma $\mathbf{2}$ there is no subspace of dimension $>$ $=2$ of time vectors
and $\boldsymbol{F}$ contains $\boldsymbol{X}$, time vector.
$\varphi_{/ F}$ being a bilinear symmetrical regular form on $F, \varphi_{/ F}$ can be represented in a $\varphi_{/ \boldsymbol{F}}$ - orthogonal basis by a diagonal matrix composed of $\mathbf{1},-\mathbf{1}$ and $\mathbf{0}$.
The nature of the vectors remaining unchanged, the only possibility is therefore 1 and -1. So the only possibility for $\boldsymbol{p}$ is $\boldsymbol{p}=1$.
Therefore $\operatorname{sign}\left(\operatorname{det}\left({ }^{t} \boldsymbol{S G S}\right)\right)=-1$ et donc $\|\boldsymbol{X}\|_{\boldsymbol{G}}{ }^{2}\|\boldsymbol{I}\|_{\boldsymbol{G}}{ }^{2}<\left({ }^{t} \boldsymbol{X G Y}\right)^{2}$.
Note;
We recall that the set of time vectors do not form a vector subspace take for example; $\boldsymbol{X}={ }^{\boldsymbol{t}}(4,1,1,1)$ et $\boldsymbol{Y}={ }^{\boldsymbol{t}}(-4,1,1,1)$ et $\boldsymbol{X}+\boldsymbol{Y}={ }^{\boldsymbol{t}}(\mathbf{0}, 2,2,2)$.

## Lemme 7:

Let $\boldsymbol{X}, \boldsymbol{Y}$ and $\boldsymbol{Z} 3$ time or isotrope-vectors we then have:

$$
\left({ }^{t} X G Y\right)\left({ }^{t} \mathbf{Y G Z}\right)\left({ }^{t} \mathbf{Z G X}\right) \geq\left({ }^{t} \mathbf{X} G X\right)\left({ }^{t} \mathbf{Y G Y}\right)\left({ }^{t} \boldsymbol{Z} G Z\right)
$$

## Proof:

Let's consider $\boldsymbol{S}=[\boldsymbol{X}, \boldsymbol{Y}, \boldsymbol{Z}]$, we have :

$$
\begin{aligned}
& { }^{t} S G S=\left[\begin{array}{c}
{ }^{t} X \\
{ }^{t_{Y}} \\
{ }^{t_{Z}}
\end{array}\right]\left[\begin{array}{cc}
1 & 0 \\
0 & -I d_{\mathbb{R}^{3}}
\end{array}\right][X, Y, Z]=\left[\begin{array}{cccc}
X_{1} & -X_{2} & -X_{3} & -X_{4} \\
Y_{1} & -Y_{2} & -Y_{3} & -Y_{3} \\
Z_{1} & -Z_{2} & -Z_{3} & -Z_{4}
\end{array}\right]\left[\begin{array}{lll}
X_{1} & Y_{1} & Z_{1} \\
X_{2} & Y_{2} & Z_{2} \\
X_{3} & Y_{3} & Z_{3} \\
X_{4} & Y_{3} & Z_{4}
\end{array}\right] \\
& =\left[\begin{array}{lll}
{ }^{t} X G X & t_{X G Y} & { }^{t} X G Z \\
t_{Y G X} & { }^{t} Y G Y & { }^{t} \boldsymbol{Y} \boldsymbol{Y} Z \\
{ }^{t} \boldsymbol{Z G X} & t_{Z G Y} & { }^{t_{Z G Z}}
\end{array}\right]
\end{aligned}
$$

$$
\begin{aligned}
& { }_{-}{ }^{t} X G Y\left[{ }^{t} \boldsymbol{Y} G X \cdot{ }^{t}{ }^{t} G Z-{ }^{t} \boldsymbol{Y} G Z \cdot{ }^{t} \boldsymbol{Z} G X\right] \\
& +^{t} \mathbf{X G Z}\left[{ }^{t} \mathbf{Y G X} \cdot{ }^{t} \mathbf{Z G Y}-{ }^{t} \boldsymbol{Y G Y} \cdot{ }^{t} \mathbf{Z G X}\right]
\end{aligned}
$$

$$
\begin{aligned}
& \text { then: }
\end{aligned}
$$

> Considering the sign of $\operatorname{det}\left({ }^{t} S G S\right)$ :
> If $\operatorname{det}\left({ }^{\boldsymbol{t}} \mathbf{S G S}\right)=\mathbf{0}$ the lemma is proved.
> If $\operatorname{det}\left({ }^{t} S G S\right) \neq 0$ and if $X=\lambda \boldsymbol{Y}+\mu \boldsymbol{Z}, \lambda \in \mathbb{R}^{*}, \mu \in \mathbb{R}^{*}$,

it's impossible therefore $\boldsymbol{X}, \boldsymbol{Y}$ et $\boldsymbol{Z}$ are non - collinear and form the basis of a vector subspace $F$ of $\mathbb{R}^{4}$ of dimension 3 .

By making a similar reasoning to that of the previous lemma we find that
$\operatorname{sign}\left(\operatorname{det}\left({ }^{( } \operatorname{SGS}\right)\right)=(-1)^{3-1}=1$.
Therefore $\operatorname{det}\left({ }^{t} \boldsymbol{S G S}\right)>0$ and the lemma is proved.
Lemma 8:

We consider $\mathbb{R}^{4}$ provided with the quadratic form defined by $\boldsymbol{G}=\left[\begin{array}{rr}1 & 0 \\ 0 & -\boldsymbol{I d}_{\mathbb{R}^{3}}\end{array}\right]$,
then the union of non - zero time vectors and the isotropic vectors are divided
into 2 opposite classes $\mathcal{C}_{1}$ and $\mathcal{C}_{2}$ and if $\boldsymbol{X}$ and $\boldsymbol{Y}$ are non-zero time vectors we have :
${ }^{t} \boldsymbol{X} \boldsymbol{G Y} \geq \mathbf{0} \Leftrightarrow \boldsymbol{X}$ and $\boldsymbol{Y}$ belong to the same class ,
${ }^{t} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y} \leq \mathbf{0} \Leftrightarrow \boldsymbol{X}$ and $\boldsymbol{Y}$ belong to opposite classes .
Two vectors $\boldsymbol{X}$ and $\boldsymbol{Y}$ belonging to a same class check ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}>\boldsymbol{0}$ unless they are isotropic and parallel. In this case they belong to the same class if their ratio is a strictly positive number.
Proof:
Let $\boldsymbol{X}_{\boldsymbol{0}}$ be an arbitrary non - zero time vector. A non - zero time vector $\boldsymbol{Y}$ is never orthogonal to $\boldsymbol{X}_{\boldsymbol{0}}$ because otherwise by lemma 4, $\boldsymbol{Y}$ would be a space vector so ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}}>\boldsymbol{0}$ or ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}}<\mathbf{0}$. We say that $\boldsymbol{Y} \in \mathcal{C}_{1}$ in the first case otherwise $\boldsymbol{Y} \in \mathcal{C}_{2}$. The classes are opposite : if $\boldsymbol{Y} \in \mathcal{C}_{1}$ then $-\boldsymbol{Y} \in \mathcal{C}_{2}$. The lemma 7 shows that:
$\left({ }^{\boldsymbol{t}} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{Y}\right)\left({ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Z}\right)\left({ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}}\right) \geq\left({ }^{\boldsymbol{t}} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}}\right)\left({ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}\right)\left({ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{Z}\right) \geq \mathbf{0}, \forall \boldsymbol{Y}, \forall \boldsymbol{Z}$ time vectors.
If $\boldsymbol{Y}$ and $\boldsymbol{Z}$ belong

- to the same class $\mathcal{C}_{\mathbf{1}} \quad:{ }^{\boldsymbol{t}} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{Y} \geq \mathbf{0}$ et ${ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}} \geq \mathbf{0} \Rightarrow^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Z} \geq \mathbf{0}$,
- to the same class $\mathcal{C}_{2} \quad:^{t} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{Y} \leq \mathbf{0}$ et ${ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}} \leq \mathbf{0} \Rightarrow^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G Z} \geq \mathbf{0}$
- to different classes : ${ }^{\boldsymbol{t}} \boldsymbol{X}_{\boldsymbol{0}} \boldsymbol{G} \boldsymbol{Y} \leq \mathbf{0}$ et $\boldsymbol{t}_{\boldsymbol{t}} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}} \geq \mathbf{0} \Rightarrow^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Z} \leq \mathbf{0}$ or

$$
{ }^{t} \boldsymbol{X}_{0} \boldsymbol{G} \boldsymbol{Y} \geq \mathbf{0} \text { et }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{0} \leq \mathbf{0} \Rightarrow^{t} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Z} \leq \mathbf{0} .
$$

Conversely: If ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G Z} \geq \mathbf{0}$

$$
\text { either }{ }^{t} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{Y} \geq \mathbf{0} \text { and }{ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}} \geq \mathbf{0} \Rightarrow \boldsymbol{Y} \text { and } \boldsymbol{Z} \text { belong to the same class } \mathcal{C}_{1},
$$

or $^{\boldsymbol{t}} \boldsymbol{X}_{\mathbf{0}} \boldsymbol{G Y} \leq \mathbf{0}$ and ${ }^{\boldsymbol{t}} \boldsymbol{Z} \boldsymbol{G} \boldsymbol{X}_{\mathbf{0}} \leq \mathbf{0} \Rightarrow \boldsymbol{Y}$ and $\boldsymbol{Z}$ belong to the same class $\mathcal{C}_{\mathbf{2}}$,
in the same way if ${ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Z} \leq \mathbf{0} \Rightarrow \boldsymbol{Y}$ et $\boldsymbol{Z}$ belong to different classes .
The last part of the lemma is a direct consequence of lemma 3.
Note: In an arbitrary way the elements of one of the $\mathbf{2}$ classes are called vectors of future, the elements of the other vectors of past.

## Lemme 9:

Soient $\boldsymbol{X}$ et $\boldsymbol{Y} 2$ vecteurs de temps ou isotropes.
Si $\boldsymbol{X}$ et $\boldsymbol{Y}$ appartiennent à la même classe, leur somme est encore un vecteur de la même classe, et ils vérifient la contre - inégalité triangulaire si on note $\|\boldsymbol{X}\|_{\boldsymbol{G}}=\sqrt{{ }^{t} \boldsymbol{X} \boldsymbol{X}}$ si ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{X} \geq \mathbf{0}$ :

$$
\|X+Y\|_{G} \geq\|X\|_{G}+\|Y\|_{G}
$$

## Proof:

From the lemma $\mathbf{8}{ }^{\boldsymbol{t}} \boldsymbol{X G Y} \geq \mathbf{0}$ and from the lemma $\mathbf{6}\left|{ }^{\boldsymbol{t}} \boldsymbol{X G Y}\right| \geq\|\boldsymbol{X}\|_{\boldsymbol{G}} \mid \boldsymbol{Y} \|_{\boldsymbol{G}}$ and then $\boldsymbol{X G Y} \geq\|\boldsymbol{X}\|_{\boldsymbol{G}} \|\left.\boldsymbol{I}\right|_{\boldsymbol{G}}$, therefore :

$$
\begin{aligned}
& \left.\qquad\|\boldsymbol{X}+\boldsymbol{Y}\|_{\boldsymbol{G}}{ }^{2}=^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{G}(\boldsymbol{X}+\boldsymbol{Y})\right)=\|\boldsymbol{X}\|_{\boldsymbol{G}}{ }^{2}+\|\boldsymbol{Y}\|_{\boldsymbol{G}}{ }^{2}+\mathbf{2}^{t} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y} \\
& \geq\|\boldsymbol{X}\|_{\boldsymbol{G}}^{2}+\|\boldsymbol{Y}\|_{\boldsymbol{G}}{ }^{2}++\mathbf{2}\|\boldsymbol{Y}\|_{\boldsymbol{G}}\|\boldsymbol{X}\|_{\boldsymbol{G}}=\left(\|\boldsymbol{X}\|_{\boldsymbol{G}}+\|\boldsymbol{X}\|_{\boldsymbol{G}}\right)^{2} \\
& \text { If } \boldsymbol{V} \text { is a vector taken in the same class of } \boldsymbol{X} \text { et } \boldsymbol{Y} \text {, we have: }
\end{aligned}
$$

 therefore to the class of $\boldsymbol{X}$ and $\boldsymbol{Y}$.
Note:
(1)If $\boldsymbol{X}$ and $\boldsymbol{Y}$ are $\mathbf{2}$ vectors of class different the sum can be of any kind:

If $\boldsymbol{X}={ }^{\boldsymbol{t}}(\mathbf{2}, 1,1,1),{ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{X}=1$ and $Y={ }^{\boldsymbol{t}}(-3,1,1,1),{ }^{\boldsymbol{t}} \boldsymbol{Y} \boldsymbol{G} \boldsymbol{Y}=\mathbf{6}$, then ${ }^{\boldsymbol{t}} \boldsymbol{X} \boldsymbol{G} \boldsymbol{Y}=-3$, $\left.X+\boldsymbol{Y}={ }^{\boldsymbol{t}}(-1,2,2,2),{ }^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{G}(\boldsymbol{X}+\boldsymbol{Y})\right)=-11$ (space vector) .
If $X={ }^{t}(4,1,1,1),{ }^{t} X G X=13$ and $Y={ }^{t}(-1,0,0,0),{ }^{t} Y G Y=1$, then ${ }^{t} X G Y=-4$, $\left.\boldsymbol{X}+\boldsymbol{Y}={ }^{\boldsymbol{t}}(\mathbf{3}, 1,1,1),{ }^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{G}(\boldsymbol{X}+\boldsymbol{Y})\right)=\mathbf{6}$ (time vector).
If $X={ }^{t}(3,1,1,1),{ }^{t} \boldsymbol{X} \boldsymbol{G} X=6$ and $Y=\left(-2, \frac{\sqrt{3}}{3}-1, \frac{\sqrt{3}}{3}-1, \frac{\sqrt{3}}{3}-1\right),{ }^{t} \boldsymbol{Y} \boldsymbol{Y} Y=\frac{2 \sqrt{3}}{3}$, ${ }^{\text {then }}{ }^{t} \boldsymbol{X G Y}=-3, X+Y={ }^{t}\left(1, \frac{\sqrt{3}}{3}, \frac{\sqrt{3}}{3}, \frac{\sqrt{3}}{3}\right)$,
$\left.{ }^{\boldsymbol{t}}(\boldsymbol{X}+\boldsymbol{Y}) \boldsymbol{G}(\boldsymbol{X}+\boldsymbol{Y})\right)=\boldsymbol{0}($ isotropic vector $)$.
(2) The triangular counter inequality gives a geometric explanation of the twin - paradox.

## (6)Classification of Lorentz matrices.

We have seen that the set of Lorentz matrices $\mathcal{L}$ o of order $\boldsymbol{n}$ forms a subgroup of $\boldsymbol{G L}_{4}(\mathbb{R})$,
the group of invertible matrices. We can write a Lorentz matrix $\boldsymbol{M}$ in the most general writing :
$\boldsymbol{M}=\exp (\alpha N)\left[\begin{array}{ll}\varepsilon & 0 \\ 0 & \Omega\end{array}\right]$ where $\alpha \in \mathbb{R}, N=\left[\begin{array}{ll}0 & { }^{t} \boldsymbol{X} \\ \boldsymbol{X} & \boldsymbol{O}\end{array}\right], X \in \mathbb{R}^{3}$
As ${ }^{\boldsymbol{t}} \boldsymbol{M G M}=\boldsymbol{G}$ avec $\boldsymbol{G}=\left[\begin{array}{cc}1 & \boldsymbol{t}_{\boldsymbol{0}} \\ \boldsymbol{0} & -\boldsymbol{I d}_{\mathbb{R}^{3}}\end{array}\right], \operatorname{det}(\boldsymbol{M})= \pm \mathbf{1}$.
But $\operatorname{det}(\exp (\alpha N))=e^{\operatorname{Tr}(\alpha N)}=e^{0}=1$ therefore
$\operatorname{det}(M)=\operatorname{det}\left(\left[\begin{array}{cc}\varepsilon & 0 \\ 0 & \Omega\end{array}\right]\right)=\varepsilon \cdot \operatorname{det}(\Omega)$.
(2) Determination of $\mathcal{E}$

Let $\boldsymbol{V}_{\mathbf{0}}$ be a non - zero time vector ${ }^{\boldsymbol{t}} \boldsymbol{V}_{\mathbf{0}} \boldsymbol{G} \boldsymbol{V}_{\mathbf{0}}>\boldsymbol{0}$ and $\boldsymbol{M}$ a Lorentz matrix. We have :
${ }^{\boldsymbol{t}}\left(\boldsymbol{M} \boldsymbol{V}_{\boldsymbol{0}}\right) \boldsymbol{G}\left(\boldsymbol{M} \boldsymbol{V}_{\boldsymbol{0}}\right)={ }^{\boldsymbol{t}} \boldsymbol{V}_{\boldsymbol{0}}\left({ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}\right) \boldsymbol{V}_{\boldsymbol{0}}={ }^{\boldsymbol{t}} \boldsymbol{V}_{\boldsymbol{0}} \boldsymbol{G} \boldsymbol{V}_{\boldsymbol{0}}>\boldsymbol{0}$ so $\boldsymbol{M} \boldsymbol{V}_{\boldsymbol{0}}$ is also a time vector.
Let $\boldsymbol{\eta}=\boldsymbol{\operatorname { s i g n }}\left({ }^{\boldsymbol{t}} \boldsymbol{V}_{0} \boldsymbol{G}\left(\boldsymbol{M V}_{0}\right)\right)$ si $\boldsymbol{\eta}=\mathbf{1}, \boldsymbol{V}$ and $\left(\boldsymbol{M V}_{0}\right)$ belong to the same class otherwise $\boldsymbol{\eta}=-\mathbf{1}$,
$\boldsymbol{V}$ and $\left(\boldsymbol{M}_{\mathbf{0}}\right)$ belong to different classes .
Now let $\boldsymbol{V}$ be another non - zero time vector. As previously $\boldsymbol{M V}$ is also a time vector.
As ${ }^{\boldsymbol{t}}(\boldsymbol{M V}) \boldsymbol{G}\left(\boldsymbol{M} \boldsymbol{V}_{\mathbf{0}}\right)={ }^{\boldsymbol{t}} \boldsymbol{V}\left({ }^{\boldsymbol{t}} \boldsymbol{M} \boldsymbol{G M}\right) \boldsymbol{V}_{\boldsymbol{0}}={ }^{\boldsymbol{t}} \boldsymbol{V} \boldsymbol{G} \boldsymbol{V}_{\boldsymbol{0}}$, we have the equivalence :
$\boldsymbol{C l a s s}(\boldsymbol{V})=\boldsymbol{C l a s s}\left(\boldsymbol{V}_{\mathbf{0}}\right) \Leftrightarrow \boldsymbol{C l a s s}(\boldsymbol{M V})=\boldsymbol{C l a s s}\left(\boldsymbol{M V}_{\mathbf{0}}\right)$.
So $\boldsymbol{\eta}$ depends only on $\boldsymbol{M}$ and is independent of $\boldsymbol{V}$.
Let us calculate $\boldsymbol{\eta}$ for the vector $\boldsymbol{E}_{\boldsymbol{0}}={ }^{\boldsymbol{t}}(\mathbf{1}, \mathbf{0}, \mathbf{0}, \mathbf{0})$ :

If $\boldsymbol{\varepsilon}=1$ we will say that $\boldsymbol{M}$ is orthochronous otherwise if $\boldsymbol{\varepsilon}=-\mathbf{1}$, we will say that $\boldsymbol{M}$ is antichronous. As $\operatorname{det}(\boldsymbol{M})=\boldsymbol{\varepsilon} \cdot \operatorname{det}(\Omega)$ we have
$\operatorname{det}(M)=+1 \Leftrightarrow \varepsilon=+1$ and $\operatorname{det}(\Omega)=+1$ or $\varepsilon=-1$ and $\operatorname{det}(\Omega)=-1$.
And if $\operatorname{det}(\boldsymbol{M})=-1 \Leftrightarrow \varepsilon=-1$ et $\boldsymbol{\operatorname { d e t }}(\Omega)=+1$ or $\varepsilon=+1$ and $\operatorname{det}(\Omega)=-1$.
Let be the following subsets of $\mathcal{L}$ :
$\operatorname{Roo}=\{\boldsymbol{M} / \varepsilon=+1$ et $\operatorname{det}(\Omega)=+1\}$, the orthochronous rotation group,
Roo is a group called the restricted Lorentz groupsincefor 2 matrices of Roo:
Met $\boldsymbol{M}^{\prime}$, we have :
$\operatorname{det}\left(M M^{\boldsymbol{r}^{-1}}\right)=\operatorname{det}(M) \operatorname{det}^{-1}\left(M^{\prime}\right)=\varepsilon \cdot \operatorname{det}(\Omega) \varepsilon^{\prime} \cdot \operatorname{det}\left(\Omega^{\prime}\right)=+1$.
Roa $=\{M / \varepsilon=-1$ et $\operatorname{det}(\Omega)=+1\}$, the antichronous rotations,
$\operatorname{Reo}=\{M / \varepsilon=+1$ et $\operatorname{det}(\Omega)=-1\}$, the orthochronous inversions,
$\operatorname{Rea}=\{M / \varepsilon=-1$ et $\operatorname{det}(\Omega)=-1\}$, the antichronous inversions
We note $\mathfrak{R o o} \cup \mathfrak{R o a}=\{\boldsymbol{M} / \operatorname{det}(\Omega)=+1\}$ is a group, the rotation group,
and $\operatorname{Roo} \cup \mathfrak{R e o}=\{\boldsymbol{M} / \varepsilon=+1\}$, the orthochronous group,
and $\operatorname{Roo} \cup \operatorname{Rea}=\{M / \varepsilon=+1$ and $\operatorname{det}(\Omega)=+1$ or $\varepsilon=-1$ and $\operatorname{det}(\Omega)=-1\}$, the pair group.
We can also consider the set of matrices of Lorentz such as $\Omega=\boldsymbol{I d}_{\mathbb{R}^{3}}, \boldsymbol{\varepsilon}=+\mathbf{1}$ and $\overrightarrow{\boldsymbol{\beta}}=\boldsymbol{\beta}_{\boldsymbol{x}} \overrightarrow{\boldsymbol{i}}$ :
Therefore $\boldsymbol{M}=\left[\begin{array}{cccc}\gamma & \gamma \beta_{x} & 0 & 0 \\ \gamma \beta_{x} & \gamma & 0 & 0 \\ \mathbb{T} & & & \boldsymbol{I d} \boldsymbol{R}_{\mathbb{R}^{2}}\end{array}\right]$ with $\mathbb{T}=\left[\begin{array}{ll}0 & 0 \\ 0 & 0\end{array}\right]$.
It is easy to check that this set is a group of composition : the special group or boost :
We also note that:
$\boldsymbol{M} \boldsymbol{M}^{\prime}=\left[\begin{array}{cccc}\gamma & \gamma \beta_{x} & 0 & 0 \\ \gamma \beta_{x} & \gamma & 0 & 0 \\ \mathbb{T} & & I d_{\mathbb{R}^{2}}\end{array}\right]\left[\begin{array}{cccc}\gamma^{\prime} & \gamma^{\prime} \beta_{x}^{\prime} & 0 & 0 \\ \gamma^{\prime} \beta_{x}^{\prime} & \gamma^{\prime} & 0 & 0 \\ \mathbb{T} & & I d_{\mathbb{R}^{2}}\end{array}\right]=\gamma \gamma^{\prime}\left[\begin{array}{cccc}1+\beta_{x} \beta_{x}^{\prime} & \beta_{x}+\beta_{x}^{\prime} & 0 & 0 \\ \beta_{x}+\beta_{x}^{\prime} & 1+\beta_{x}{\beta_{x}}_{x}^{\prime} & 0 & 0 \\ \mathbb{T} & & I d_{\mathbb{R}^{2}}\end{array}\right]$.
We notice that this group is commutative.
